1 Introduction

1.1 Project Overview

The County Sanitation District No. 5 of Los Angeles County (District) owns and operates the Gardena Pumping Plant (Plant), which receives wastewater flows from throughout Los Angeles County (County). The Gardena Pumping Plant is composed of two plants, constructed side by side within two brick buildings: the Gardena East Pumping Plant (East Plant) and the Gardena West Pumping Plant (West Plant). The two plants receive flows from different sewers. District staff evaluated the functionality of the Gardena Pumping Plant and identified a number of safety, reliability, and maintenance issues with the existing facilities. To address these issues, staff proposes a project to consolidate the East Plant and West Plant into one new pumping plant near their existing location. The proposed Gardena Pumping Plant Upgrades (proposed project) involves the replacement of the plants' superstructure, the replacement of pumps, deep excavation for a new dry/wet well, improvement of force mains and cross connections, and upgrading associated equipment. The proposed project would also include decommissioning and demolition of the existing facility.

1.2 California Environmental Quality Act Compliance

The California Environmental Quality Act (CEQA) (California Public Resources Code section 21000 et seq.) is the main statutory basis for the environmental review of projects in California. CEQA emphasizes the need for public disclosure and identifying and mitigating any environmental impacts associated with proposed projects. Unless a project falls within exemptions set forth in CEQA or the CEQA Guidelines (14 CCR 15000 et seq.), it requires environmental review under CEQA. The proposed project does not fall within any exemptions set forth in CEQA or the CEQA Guidelines.

The District, as lead agency, has prepared an initial study (IS) to evaluate potential environmental effects of the proposed project and to determine whether an environmental impact report (EIR), a negative declaration, or a mitigated negative declaration (MND) should be prepared. CEQA Guidelines Section 15070(b) provides that an MND is prepared for a project when an IS has identified potentially significant effects on the environment, but (1) revisions to the project's plans or proposals made or agreed to by the applicant before release of an MND for public review would avoid or mitigate environmental effects to a point where no significant effect on the environment would occur, and (2) there is no substantial evidence in the whole record before the public agency that the project, as revised, may have a significant effect on the environment.

The IS determined that, while the implementation of the proposed project could cause some potentially significant impacts on the environment, all of the project's potentially significant impacts would be reduced to less-than-significant levels by the implementation of mitigation measures. Therefore, the District has prepared an MND for the proposed project.

1.3 Document Organization

This MND is composed of four chapters:

- Chapter 1, Introduction, provides a general overview of the proposed project, CEQA requirements related to the project, the organization of this MND, and documents incorporated by reference.

- Chapter 2, Project Description, includes a description of the proposed project's location, environmental setting, project components, construction, and required approvals.
- Chapter 3, Initial Study Checklist, presents the CEQA initial study checklist, which provides an assessment of potential environmental impacts and identifies mitigation measures that would reduce potentially significant impacts to less-than-significant levels.
- Chapter 4, References and Preparers, provides citations for the sources referenced in this document and includes a list of consultants involved in preparing the MND.

The MND also includes several appendices that contain technical data related to air quality and greenhouse gas (GHG) emissions, cultural resources, hazards and hazardous materials, and noise.

1.4 Preparation and Processing of this CEQA Document

The District directed and supervised the preparation of this IS/MND. Although prepared with assistance from the consulting firm Dudek, the content contained within and the conclusions drawn by this IS/MND reflect the independent judgment of the District.

1.5 Public Review Process

In accordance with CEQA, the District made a good-faith effort during preparation of this MND to contact affected agencies, organizations, and persons who may have interest in the proposed project. As required by CEQA, the District shall provide adequate time for other public agencies and members of the public to review and comment on the CEQA document that has been prepared. This IS/MND has been made available to members of the public, agencies, and interested parties for a 20-day public review period in accordance with CEQA Guidelines Section 15105. Public review of the IS/MND is intended to focus "on the proposed finding that the project will not have a significant effect on the environment. If persons and public agencies believe that the project may have a significant effect, they should: (1) identify the specific effect, (2) explain why they believe the effect would occur, and (3) explain why they believe the effect would be significant" (14 CCR 15204).

This IS/MND is available for review during the 20-day public review period at the following locations.

2 Project Description

2.1 Project Location

The Gardena Pumping Plant is located in the southern portion of the City of Gardena (City), adjacent to the City of Torrance. The project site is in the South Bay region of Los Angeles County, between the cities of Torrance and Carson. Generally, the project site is located northwest of the intersection of Interstate (I-) 405 and State Route (SR-) 110 and west of the Dominguez Channel. Specifically, the project site is located at 1919, 1923, and 1931 Artesia Boulevard, Gardena, California 90274 (Figure 1, Project Location).

Surrounding Land Uses

The project site is located within a highly developed, urbanized portion of the City. The area surrounding the project site is a predominantly commercial area with some residential uses. To the north of project site is a commercial auto-body shop with an associated surface parking lot to the east. To the west are several commercial buildings, and to the west of Gramercy Place are residential uses. To the south is the City of Torrance, Artesia Boulevard, surface parking lots, a construction company building, and Momin Lodge, an Islamic Center. To the east, beyond the Dominguez Channel, are other auto-related commercial buildings (Figure 2, Surrounding Land Uses).

2.2 Environmental Setting

Districts' Wastewater Collection System

The District is part of a confederation of sanitation districts, the County Sanitation Districts of Los Angeles County (Districts) that provides wastewater management for approximately 5.6 million people in the County. The Districts' service area covers approximately 850 square miles and encompasses 78 cities and unincorporated Los Angeles County. That area includes approximately 9,500 miles of sewers that are owned and operated by the cities and County, which are tributary to the Districts' wastewater collection system. The Districts own, operate, and maintain approximately 1,400 miles of sewers, ranging from 8 to 144 inches in diameter, that convey approximately 500 million gallons per day of wastewater to 11 wastewater treatment plants. Included in the Districts' wastewater collection system are 48 active pumping plants located throughout the County. In general, the sewerage system is designed to operate by conveying wastewater flow by gravity. Pumping plants are located at low points in the wastewater collection system to pump flows from lower to higher elevations, which then allows the wastewater to continue to flow by gravity (Districts 2014).

Existing Gardena Pumping Plant

The Gardena Pumping Plant is composed of two functionally separate pumping plants referred to as the East Plant and West Plant located side by side within two brick buildings totaling 885 square feet (Figure 3, Existing Gardena Pumping Plant). Key elements of the pumping plants include wet wells, pumps, piping and associated valves, equipment control and alarm systems, and ventilation systems. The two plants receive flows from different sewers, and both plants are capable of routing effluent through pressure pipes known as force mains back to two separate downstream sewers. The Gardena Pumping Plant is part of critical, uninterruptible infrastructure to convey sewage from the tributary area and there are no existing diversions available to bypass the pumping plant.

Failure of the Gardena Pumping Plant would require emergency response efforts to re-route sewage as continuous operation of the plant is critical to the health and welfare of residents and the environment.

The East Plant and Force Main No. 1 were constructed in 1928; the West Plant and Force Main No. 2 were constructed in 1960; and Force Main No. 3 was constructed in 1995. In 1970, the East Plant underwent a comprehensive renovation during which its structural shell was retained but its interior was completely reconstructed. Additionally, the original 20-inch Force Main No. 1 was removed and replaced with a 16-inch pipe.

As depicted in Figure 4, Existing Site Layout, under normal operation the influent wastewater flows from the west of the project site are received by the West Plant's wet well through the 36-inch Gramercy Place Trunk Section 1 Sewer and the 24-inch Moneta Extension Trunk Sewer (shown as an orange line). The West Plant then pumps effluent through Force Main No. 3 to the J.O. "A"–1A District No. 5 Interceptor Relief Sewer (shown as a green line). The West Plant can also pump effluent through Force Main No. 2 to the J.O. "D"–2B Sewer if necessary for emergency operations. Additionally, , as shown in Figure 4, influent from the east of the project site is received by the East Plant's wet well through the 24-inch Gardena Pump trunk sewer (shown as an orange line). The East Plant then pumps effluent through Force Main No. 1 to the J.O. "D"–2B Sewer (shown as a green line). The East Plant can also pump effluent through Force Main No. 3 to the J.O. "A"–1A District No. 5 Interceptor Relief Sewer if necessary for emergency operations. The current flow capacities of the East and West Plants are described in Table 1, Flow Capacity.

Table 1. Flow Capacity

Pumping Plant	Dry Weather Peak (gpm)	Low (gpm)	Average (gpm)
West Plant	6,750	1,500	5,750
East Plant	2,300	500	1,750
Combined	**9,050**	**2,000**	**7,500**

Source: Districts 2007
Note: gpm = gallons per minute

The pumping plants operate as "constant level" pumping plants utilizing level indicators and pump control systems to maintain fixed wet-well elevations. The wet wells of the East and West Plants are connected by manhole 2016, located south of the project within the right-of-way of Artesia Boulevard. When the level in the west wet well reaches an elevation of 23.1 feet, the influent sewer will overflow a weir at manhole 2016, thereby permitting influent flow to bypass the West Plant to the East Plant (as shown on Figure 4).

Under normal conditions, the West Plant maintains the wet well at a constant level using one pump with a 75-horsepower electric motor, and the East Plant maintains the wet well at constant level using one pump with a 60-horsepower electric motor. Although each plant utilizes only one pump to maintain constant levels in the wet wells, both have an additional pump for redundancy if the primary pump fails or influent flows exceed the capacity of the primary pumps. The pumps are operated using electrical motors and are normally powered from a service connection to the Southern California Edison (SCE) power grid. In the event of a loss of power, a 150-kilowatt (kW) standby, diesel-engine-powered generator, which is permanently installed behind the West Plant, serves both plants. The generator is configured to sense loss of power and to automatically provide enough electrical power to run the plants under dry-weather conditions. Currently, the permanent diesel-powered generator does not have enough capacity to provide power to the plants under heavy wet weather conditions. In the event of forecast rain, an additional temporary generator is brought to the site to provide adequate capacity to continue to run the plants if primary electrical grid power is lost during the rain event.

Operation and Maintenance

The pumping plants are visited daily by a pumping plant operator. Routine visits include inspection of the pumps, piping, valves, electrical equipment, and force mains. During these visits, the operator confirms that the plants are operating normally and notes any deficiencies that would require follow-up work. In addition to the pumping plant operators, other trained personnel including electrical and instrumentation technicians and stationary mechanics visit the site on a periodic basis to support routine maintenance and repair of various systems. The pumping plants are also remotely monitored and operated through a Supervisory Control and Data Acquisition (SCADA) system. The SCADA system provides critical, real-time operational data about the plants, including wet well level and pump status. The SCADA system can be accessed at the Long Beach Main Pumping Plant Central Alarm Center, the Compton Field Office, and the Joint Administration Building (located in Whittier) (Districts 2014). In particular, the Long Beach Main Pumping Plant Central Alarm Center is staffed 24-hours per day providing continuous monitoring of all Districts' pumping plants.

The pumping plants are designed for uninterruptible operation through features such as redundant pumps, redundant force mains, and backup generators. Nevertheless, the Districts maintain additional backup pumps, generators, and piping at the Compton Field Office that would be dispatched to the pumping plant to assist with emergency response (Districts 2014).

2.3 Proposed Project

The Gardena Pumping Plant is one of the largest operated by the Districts and handles approximately 8 million gallons of sewage per day, which is equivalent to the sewage flow from approximately 30,000 single-family homes (see Figure 5, Service Area). This pumping plant is a critical piece of infrastructure, and its operation cannot be interrupted. However, the existing equipment is outdated and at the end of its service life, and the Districts cannot safely upgrade the existing site to meet current design and operational guidelines while keeping it in service.

The proposed project would address the existing safety, reliability, and maintenance issues of the existing Gardena Pumping Plant by consolidating the East and West Plants into one new pumping plant near the existing location (Figure 6, Preliminary Site Layout). The proposed project would generally include the following:

- Replacement of plant superstructure;
- Replacement of pumps;
- Deep excavation for a new dry/wet well;
- Replacement of the diesel-powered backup generator;
- Improvement of force mains and cross connections;
- Associated equipment upgrades; and
- Demolition of the existing Plant.

The proposed project would serve the same function as the existing Gardena Pumping Plant and would continue to accept wastewater flows from the 36-inch Gramercy Place Trunk Sewer Section 1, the 24-inch Moneta Extension Trunk Sewer, and the 24-inch Gardena Pump Trunk Sewer. All of the wastewater from these three influent sewers would be directed to one new wet well through new piping and cross connections. The proposed flow capacities of the upgraded Gardena Pumping Plant would be the same as current combined flows for the

East and West Plants (see Table 1, Flow Capacity). The effluent would be directed back to the Districts' wastewater collection system through new force main connections. Operation and maintenance activities would largely be the same as those for the existing plant, but consolidating the functionally separate plants into one plant will simplify maintenance by reducing the amount of equipment that needs to be maintained. For example, the four existing pumps would be replaced with three or fewer pumps that would reduce the amount of required maintenance. The proposed project would be designed for uninterruptible operation and simplified emergency response through the addition of features such as redundant pumps, redundant force mains, and backup generators. The new pumping plant superstructure would be approximately 600 square feet and its structure would be 13 feet high. Because the existing plant must be continually in operation, the new plant would be constructed adjacent to it. When the new plant is operational, the old plants would be decommissioned and demolished.

Another of the proposed project's features is the replacement of the existing standby electrical generator with a larger generator with adequate capacity to provide electrical power under wet- and dry-weather conditions. This would eliminate the need for a temporary electrical generator during rain events.

2.4 Project Construction

Construction of the proposed project is anticipated to commence in 2021 and last approximately 30 months. The existing pumping plant would remain in operation until the proposed project is completed. After the proposed plant has been completed and tested, all influent flows would be directed to the upgraded plant. The existing Plant would be demolished following the construction, testing, and operation of the proposed replacement plant.

The proposed project's area of disturbance includes the existing plant, the property of the proposed pumping plant to the west, and a portion of the sidewalk/roadway on Artesia Boulevard. Construction of the upgraded pumping plant would involve deep excavation for the new dry/wet well; installation of the new influent cross connections, manhole, pumps, and discharge piping; and construction of a new superstructure over the dry/wet well. Construction of the proposed project would require temporary lane closures at Artesia Boulevard; however, traffic controls, including a flagman (as necessary), would be used to reduce traffic impacts and ensure pedestrian safety. A construction staging area would likely be located on site for construction of the plant structure. However, the location of the staging area for the street/sewer work will be determined by the contractor.

Because excavation is anticipated to reach up to 40 feet below ground surface (bgs), dirt would have to be hauled off site. The proposed hauling route and destination will be determined by the contractor pursuant to a Construction Traffic Management Plan.

2.5 Project Approvals

The proposed project would require the following approvals:

- City of Torrance Construction/Encroachment Permit (temporary lane closures on Artesia Boulevard and street excavation);
- City of Gardena Construction/Encroachment Permit (temporary lane closures on Artesia Boulevard and street excavation);
- Los Angeles County Fire Department (as necessary for occupied structures); and

- South Coast Air Quality Management District (SCAQMD) (for installation and operation of new diesel-powered back up electrical generator).

(NOTE: For the construction of wastewater treatment and conveyance facilities such as this, the Districts would generally be exempt from other City/County building approvals/permits in disciplines such as grading, structural, plumbing, and electrical. However, all design/construction activities will adhere to minimum code requirements, including design for seismic hazards.)

3 Initial Study Checklist

1. **Project title:**

   Gardena Pumping Plant Upgrades

2. **Lead agency name and address:**

   County Sanitation District No. 5 of Los Angeles County
   1955 Workman Mill Road
   Whittier, California 90601

3. **Contact person and phone number:**

   Debra Bogdanoff, Senior Engineer
   562.908.4288 ext. 2734

4. **Project location:**

   1919, 1923, and 1931 Artesia Boulevard,
   Gardena, California 90247

5. **Project sponsor's name and address:**

   County Sanitation District No. 5 of Los Angeles County
   1955 Workman Mill Road
   Whittier, California 90601

6. **General plan designation:**

   Industrial

7. **Zoning:**

   General Commercial Zone (Z-3)

8. **Description of project (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary.):**

   The proposed project would address existing safety, reliability, and maintenance issues of the existing Gardena Pumping Plant by consolidating the East and West Plants into one new pumping plant near the existing location. The proposed project would involve the replacement of plant superstructure, the replacement of pumps, the deep excavation for a new dry/wet well, the improvement of force mains and cross connections, the upgrading of associated equipment, and the demolition of the existing plant.

9. **Surrounding land uses and setting (Briefly describe the project's surroundings):**

The project site is located within a highly developed, urbanized portion of the City. The area surrounding the project site is within a predominantly commercial area with some residential uses. To the north of project site is a commercial auto-body shop with an associated surface parking lot to the east. To the west are several commercial buildings, and to the west of Gramercy Place are residential uses. To the south are the City of Torrance; Artesia Boulevard; surface parking lots; a construction company building; and Momin Lodge, an Islamic Center. To the east, beyond the Dominguez Channel, are other auto-related commercial buildings.

10. **Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement):**

- City of Gardena
- City of Torrance
- Los Angeles County Fire Department
- SCAQMD

11. **Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?**

Yes. See Section 3.18, Tribal Cultural Resources, for further details.

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

☐ Aesthetics	☐ Agriculture and Forestry Resources	☐ Air Quality
☐ Biological Resources	☐ Cultural Resources	☐ Energy
☐ Geology and Soils	☐ Greenhouse Gas Emissions	☐ Hazards and Hazardous Materials
☐ Hydrology and Water Quality	☐ Land Use and Planning	☐ Mineral Resources
☐ Noise	☐ Population and Housing	☐ Public Services
☐ Recreation	☐ Transportation	☐ Tribal Cultural Resources
☐ Utilities and Service Systems	☐ Wildfire	☐ Mandatory Findings of Significance

Determination (to be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Signature

4/30/19
Date

Evaluation of Environmental Impacts

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.
4. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less-Than-Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less-than-significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).
5. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
   a. Earlier Analysis Used. Identify and state where they are available for review.
   b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
   c. Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
9. The explanation of each issue should identify:
   a. The significance criteria or threshold, if any, used to evaluate each question; and
   b. The mitigation measure identified, if any, to reduce the impact to less than significance.

	Potentially Significant Impact	Less-Than-Significant Impact With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
I. AESTHETICS – Except as provided in Public Resources Code section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b) Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☐	☒
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐
II. AGRICULTURE AND FORESTRY RESOURCES – In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

	Potentially Significant Impact	Less-Than-Significant Impact With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
III. AIR QUALITY – Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☐	☒	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐
IV. BIOLOGICAL RESOURCES – Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☐	☒
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒
f) Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒
V. CULTURAL RESOURCES – Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☐	☐	☒	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☒	☐

	Potentially Significant Impact	Less-Than-Significant Impact With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
VI. Energy – Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☐	☒
VII. GEOLOGY AND SOILS – Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☐	☒
ii) Strong seismic ground shaking?	☐	☐	☒	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☐	☒
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☐	☒
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐
VIII. GREENHOUSE GAS EMISSIONS – Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐
IX. HAZARDS AND HAZARDOUS MATERIALS – Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☒	☐	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☒	☐	☐

	Potentially Significant Impact	Less-Than-Significant Impact With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☒	☐	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☒	☐	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☐	☒
X. HYDROLOGY AND WATER QUALITY – Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☐	☒
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i) result in substantial erosion or siltation on or off site;	☐	☐	☒	☐
ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;	☐	☐	☒	☐
iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
iv) impede or redirect flood flows?	☐	☐	☐	☒
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☒	☐
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐

	Potentially Significant Impact	Less-Than-Significant Impact With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
XI. LAND USE AND PLANNING – Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☐	☒
XII. MINERAL RESOURCES – Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒
XIII. NOISE – Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☒	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒
XIV. POPULATION AND HOUSING – Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☒
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒
XV. PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
Fire protection?	☐	☐	☐	☒
Police protection?	☐	☐	☐	☒
Schools?	☐	☐	☐	☒
Parks?	☐	☐	☐	☒
Other public facilities?	☐	☐	☐	☒

	Potentially Significant Impact	Less-Than-Significant Impact With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
XVI. RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒
XVII.TRANSPORTATION – Would the project:				
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☐	☐	☒	☐
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	☐	☐	☒	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☒	☐	☐
d) Result in inadequate emergency access?	☐	☒	☐	☐
XVIII. TRIBAL CULTURAL RESOURCES – Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☐	☐	☒	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	☐	☒	☐	☐
XIX. UTILITIES AND SERVICE SYSTEMS – Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	☐	☐	☒	☐

	Potentially Significant Impact	Less-Than-Significant Impact With Mitigation Incorporated	Less-Than-Significant Impact	No Impact
c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☐	☒
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☐	☒
XX. WILDFIRE – If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒
XXI. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☒	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☒	☐	☐

3.1 Aesthetics

a) Would the project have a substantial adverse effect on a scenic vista?

No Impact. Scenic vistas and other important visual resources are typically associated with natural landforms such as mountains, foothills, ridgelines, coastlines, and open space areas. Open space resources within the City include parks and other recreational facilities, such as public school facilities, parks and ball fields, landscaped medians, open area occupied by utilities, such as flood control channels and utility easements, and private recreational facilities (City of Gardena 2006a). As previously described in Section 2.1, Project Location, the Dominguez Channel, an existing flood control channel, is located approximately 160 feet to the east of the project site. In addition, construction of the proposed project would require temporary lane closures at Artesia Boulevard, immediately south of the project site, which contains a landscaped median. Although the flood control channel and landscaped median are identified as open space resources by the City, these facilities do not represent natural features.

Construction of the proposed project would not result in substantial adverse effects to the Dominguez Hills Channel. Construction within Artesia Boulevard may temporarily alter views of the landscaped median to vehicles traveling west to east; however, these would be short-term changes and would not represent a substantial adverse effect. Implementation of the proposed project would not obstruct the view of the Dominguez Hills Channel and the landscaped median at Artesia Boulevard. Further, the project site is located in a relatively flat and urbanized area that generally lacks natural landforms. Therefore, no impacts associated with scenic vistas would occur.

b) Would the project substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact. According to the California Department of Transportation (Caltrans) Scenic Highway Mapping System, there are no state scenic highways located within the vicinity of the project site. The nearest officially designated state highways is SR-2 (also known as the Angeles Crest Highway), from 2.7 miles north of SR-210 in La Cañada Flintridge north and east to the San Bernardino County line (Caltrans 2011). At SR-210 in La Cañada Flintridge, SR-2 is located approximately 24.5 miles north of the project site. All segments of the SR-2 between La Cañada Flintridge and the San Bernardino County line are greater than 24.5 miles from the project site. Because of distance and the presence of intervening (and densely vegetated) terrain of the San Gabriel Mountains, the proposed project would not be visible from the officially designated state scenic highway. Therefore, no impacts to scenic resources within an officially designated state scenic highway would occur.

In addition to officially designated state scenic highways, the State Scenic Highway Program includes eligible state scenic highways. The nearest eligible state scenic highway is a segment of SR-1 (Pacific Coast Highway), located approximately 11 miles southeast of the project site in the City of Long Beach (Caltrans 2011). Because of the intervening urban environment and natural topography located between the project site and this eligible state scenic highway, development of the proposed project would occur outside of the viewshed of this, and any other, designated scenic highway. Therefore, no impacts to eligible state scenic highways would occur.

c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

No Impact. The project site is zoned as C-3, General Commercial, and is required to comply with the City's zoning code regulations for the C-3 zone. Although the zoning code does not have specific regulations governing scenic quality, there are standards related to lot area and dimension, building height, setbacks, landscaping, fencing, access, signs, and parking.

The City of Gardena General Plan 2006 (general plan) designates the project site as Industrial. The Community Design Plan Element of the general plan sets goals and policies guiding the aesthetic qualities of existing and future development in the City (City of Gardena 2006b). The following general plan goals and policies are applicable to the proposed project:

- **DS Goal 5:** Improve the aesthetic quality of the industrial environment for both workers and residents of the City.
- **Policy DS 5.2:** Encourage the design of industrial buildings to consider the visual and physical relationship to adjacent uses. An industrial structure, which dominates the surrounding environment by its relative size, shall be discouraged.
- **Policy DS 5.3**: Industrial projects shall be required to: incorporate landscape setbacks and buffers; aesthetically treat horizontal and vertical design elements on building and perimeter walls; and conceal storage yards, parking, and service areas to minimize visual impacts on the public.

The proposed project would result in the construction of new pumping plant superstructure, which would be approximately 600 square feet and 13 feet high, compared to the existing two brick buildings totaling 885 square feet. As such, the proposed project would be slightly smaller than the existing Gardena Pumping Plant and similar in mass and scale as the existing commercial buildings surrounding the project site. Additionally, compliance with zoning code chapter 18.32.050, which sets development standards for the C-3 zone, would ensure the proposed project is designed with appropriate landscape setbacks, buffers, and other aesthetic elements (City of Gardena 2018). Further, the proposed project would consolidate the two plants into one plant to simplify maintenance and improve the quality of the project site for workers. The proposed project would not conflict with applicable zoning and other regulations governing scenic quality and there would be no impact.

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less-Than-Significant Impact. The proposed new pumping plant superstructure, pumps, dry/wet wells, generators, force mains, cross connections, and associated equipment would not generate new sources of substantial light and glare. With the exception of the plant superstructure and backup generator, all of the project construction would occur subsurface and, thus, would not produce light sources affecting day or nighttime views. The plant superstructure would require lighting similar to that of the existing facility, which is required for safety and security purposes. Based on the existing level of lighting at the Gardena Pumping Plant, new lighting associated with the proposed project would not be expected to adversely affect nighttime views in the area. The backup generator would not introduce light or glare. Additionally, the materials used in the

construction of the plant superstructure would not be expected to add a new source of glare to the project site. Furthermore, the project site is separated from residences by existing commercial buildings; therefore, there would be little to no direct line of sight for glare to travel if sources of temporary glare (e.g., construction and operations and maintenance vehicles) are found on site. Therefore, impacts would be less than significant.

3.2 Agriculture and Forestry Resources

a) Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. The proposed project would be located on a site that is currently owned and operated by the Districts. According to the California Department of Conservation's (DOC's) California Important Farmland Finder, most of Los Angeles County is not mapped under the Farmland Mapping and Monitoring Program and, thus, does not contain Prime Farmland, Unique Farmland, or Farmland of State Importance (collectively "Important Farmland") (DOC 2016a). Therefore, no impacts associated with conversion of Important Farmland would occur.

b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. The project site is zoned C-3, General Commercial, and thus, would not conflict with existing zoning for agricultural use. According the California Department of Conservation's Williamson Act Parcel map for Los Angeles County, the project site is not located on or adjacent to any lands under Williamson Act contract. The Los Angeles County Williamson Act 2015/2016 Map designates the project site and surrounding land as non-Williamson Act land (DOC 2016b). Therefore, impacts associated with existing zoning for agricultural use or a Williamson Act contract would be less than significant.

c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. No forestland, timberland, or timberland zoned Timberland Production areas (as defined in California Public Resources Code Sections 12220(g), 4526, and 51104(g)) are located within or adjacent to the project site. Therefore, the proposed project would not conflict with existing zoning for forestland, timberland, or Timberland Production areas, and no impact would occur.

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

No Impact. The project site is located in a predominantly urban area. The project site is not located on or adjacent to forestland. No private timberlands or public lands with forests are located in the City. Therefore, no impact associated with the loss or conversion of forestland would occur.

e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

No Impact. The project site is not located on or adjacent to any parcels identified as Important Farmland or forestland. In addition, the proposed project would not involve changes to the existing environment

that would result in the indirect conversion of Important Farmland or forestland located away from the project site. Therefore, no impacts associated with the conversion of Farmland or forestland would occur.

3.3 Air Quality

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less-Than-Significant Impact. The project area is located in the City, within the South Coast Air Basin (SCAB), which includes the non-desert portions of Los Angeles, Riverside, and San Bernardino counties and all of Orange County. SCAB is within the jurisdictional boundaries of SCAQMD.

SCAQMD administers the SCAB Air Quality Management Plan (AQMP), which is a comprehensive document outlining an air pollution control program for attaining the California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS). The most-recently adopted AQMP for the SCAB is the 2016 AQMP (SCAQMD 2017). The 2016 AQMP focuses on available, proven, and cost-effective alternatives to traditional air quality strategies while seeking to achieve multiple goals in partnership with other entities seeking to promote reductions in GHGs and toxic risk, as well as efficiencies in energy use, transportation, and goods movement (SCAQMD 2017).

The purpose of a consistency finding regarding the AQMP is to determine if a project is consistent with the assumptions and objectives of the 2016 AQMP, and if it would interfere with the region's ability to comply with federal and state air quality standards. SCAQMD has established criteria for determining consistency with the currently applicable AQMP in Chapter 12, Sections 12.2 and 12.3, of the SCAQMD CEQA Air Quality Handbook. These criteria are as follows (SCAQMD 1993):

- **Consistency Criterion No. 1:** Whether the project would result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timely attainment of the ambient air quality standards or interim emission reductions in the AQMP.
- **Consistency Criterion No. 2:** Whether the project would exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

To address the first criterion, project-generated criteria air pollutant emissions have been estimated and analyzed for significance and are addressed in Section 3.3(b). Detailed results of this analysis are included in Appendix A, Air Quality and Greenhouse Gas Emissions. As presented in Section 3.3(b), the proposed project would not generate criteria air pollutant emissions that exceed the SCAQMD's thresholds; therefore, the proposed project would be consistent with Criterion No. 1.

The second criterion regarding the potential of the proposed project to exceed the assumptions in the AQMP or increments based on the year of project buildout and phase is primarily assessed by determining consistency between the proposed project's land use designations and its potential to generate population growth. In general, projects are considered consistent with, and not in conflict with or obstructing implementation of, the AQMP if the growth they produce in socioeconomic factors is consistent with the underlying regional plans used to develop the AQMP (SCAQMD 1993). SCAQMD primarily uses demographic growth forecasts for various socioeconomic categories (e.g., population, housing, and employment by industry) developed by the Southern California Association of Governments (SCAG) for its 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)

(SCAG 2016). SCAQMD uses this document, which is based on general plans for cities and counties in the SCAB, to develop the AQMP emissions inventory (SCAQMD 2017).[1] The SCAG RTP/SCS and associated Regional Growth Forecast are generally consistent with the local plans; therefore, the 2016 AQMP is generally consistent with local government plans.

Since the proposed project involves upgrades to the existing pumping plant, the proposed use is consistent with the general plan Industrial designation, and zone C-3, General Commercial. In addition, the implementation of the project would not generate an increase in employment that would conflict with existing employment population projections. Accordingly, the proposed project is consistent with the SCAG RTP/SCS forecasts used in the SCAQMD AQMP development.

In summary, based on the considerations presented for the two criteria, impacts relating to the proposed project's potential to conflict with or obstruct implementation of the applicable AQMP would be less than significant.

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less-Than-Significant Impact. A quantitative analysis was conducted to determine whether the proposed project might result in emissions of criteria air pollutants that may cause exceedances of the NAAQS or CAAQS, or cumulatively contribute to existing nonattainment of ambient air quality standards. Criteria air pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide, particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}; course particulate matter), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$; fine particulate matter), and lead. Pollutants that are evaluated herein include volatile organic compounds (VOCs) and oxides of nitrogen (NO_X), which are important because they are precursors to O_3, as well as CO, sulfur oxides (SO_X), PM_{10}, and $PM_{2.5}$.

Regarding NAAQS and CAAQS attainment status,[2] the SCAB is designated as a nonattainment area for federal and state O_3 and $PM_{2.5}$ standards (CARB 2017a; EPA 2018). The SCAB is also designated as a nonattainment area for state PM_{10} standards; however, it is designated as an attainment area for federal PM_{10} standards. SCAB is designated as an attainment area for federal and state CO and NO_2 standards, as well as for state SO_2 standards. Although the SCAB has been designated as nonattainment for the federal rolling 3-month average lead standard, it is designated attainment for the state lead standard.[3]

---

1 Information necessary to produce the emissions inventory for SCAB is obtained from SCAQMD and other governmental agencies, including CARB, Caltrans, and SCAG. Each of these agencies is responsible for collecting data (e.g., industry growth factors, socioeconomic projections, travel activity levels, emission factors, emission speciation profile, and emissions) and developing methodologies (e.g., model and demographic forecast improvements) required to generate a comprehensive emissions inventory. SCAG incorporates these data into its Travel Demand Model for estimating/projecting vehicle miles traveled (VMT) and driving speeds. SCAG's socioeconomic and transportation activities projections in their 2016–2040 RTP/SCS are integrated in the 2016 AQMP (SCAQMD 2017).

2 An area is designated as in attainment when it is in compliance with the NAAQS and/or the CAAQS. These standards for the maximum level of a given air pollutant that can exist in the outdoor air without unacceptable effects on human health or the public welfare are set by the U.S. Environmental Protection Agency and CARB, respectively. Attainment = meets the standards; attainment/maintenance = achieves the standards after a nonattainment designation; nonattainment = does not meet the standards.

3 The phase-out of leaded gasoline started in 1976. Since gasoline no longer contains lead, the project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.

The proposed project would result in emissions of criteria air pollutants for which the California Air Resources Board (CARB) and U.S. Environmental Protection Agency have adopted ambient air quality standards (i.e., the NAAQS and CAAQS). Projects that emit these pollutants have the potential to cause, or contribute to, violations of these standards. The SCAQMD CEQA Air Quality Significance Thresholds, as revised in March 2015, set forth quantitative emission significance thresholds for criteria air pollutants, which, if exceeded, would indicate the potential for a project to contribute to violations of the NAAQS or CAAQS. Table 2, SCAQMD Air Quality Significance Thresholds, lists the revised SCAQMD Air Quality Significance Thresholds (SCAQMD 2015).

Table 2. SCAQMD Air Quality Significance Thresholds

Criteria Pollutants Mass Daily Thresholds		
Pollutant	*Construction (in pounds/day)*	*Operation (in pounds/day)*
VOC	75	55
NO_X	100	55
CO	550	550
SO_X	150	150
PM_{10}	150	150
$PM_{2.5}$	55	55
Lead[a]	3	3
Toxic Air Contaminants and Odor Thresholds		
TACs[b]	Maximum incremental cancer risk ≥ 10 in 1 million Cancer Burden > 0.5 excess cancer cases (in areas ≥ 1 in 1 million) Chronic and Acute Hazard index ≥ 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	

Source: SCAQMD 2015.
Notes: VOC = volatile organic compound; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter with a diameter less than or equal to 10 microns (coarse particulate matter); $PM_{2.5}$ = particulate matter with a diameter less than or equal to 2.5 microns (fine particulate matter); SCAQMD = South Coast Air Quality Management District; TAC = toxic air contaminant

[a] The phase-out of leaded gasoline started in 1976. Since gasoline no longer contains lead, the proposed project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.

[b] TACs include carcinogens and noncarcinogens.

The project would result in a substantial contribution to an existing air quality violation of the NAAQS or CAAQS for O_3, which is a nonattainment pollutant, if the proposed project's construction or operational emissions exceed the SCAQMD VOC or NO_X thresholds shown in Table 2. These emission-based thresholds for O_3 precursors are intended to serve as surrogates for an "ozone significance threshold" (i.e., the potential for adverse O_3 impacts to occur) because O_3 itself is not emitted directly, and the effects of an individual project's emissions of O_3 precursors (i.e., VOCs and NO_X) on O_3 levels in ambient air cannot be determined through air quality models or other quantitative methods.

The California Emissions Estimator Model (CalEEMod) version 2016.3.2 was used to estimate emissions from construction and operation of the proposed project. CalEEMod was also used to estimate emissions from operations of the existing pumping plant. CalEEMod is a statewide computer model developed in cooperation with air districts throughout the state to quantify criteria air pollutant emissions associated with construction and operational activities from a variety of land use projects, such as residential, commercial, and industrial facilities. The following discussion quantitatively evaluates project-generated construction and operational emissions and impacts that would result from implementation of the proposed project.

Construction Emissions

Construction of the proposed project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (e.g., off-road construction equipment, soil disturbance, and VOC off-gassing from architectural coatings and asphalt pavement application) and off-site sources (e.g., vendor trucks, haul trucks, and worker vehicle trips). Specifically, the exposure of earth surfaces to wind from the direct disturbance and movement of soil can result in entrained dust and PM_{10} and $PM_{2.5}$ emissions. Internal combustion engines used by construction equipment, haul trucks, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of VOC, NO_X, CO, PM_{10}, and $PM_{2.5}$. Application of architectural coatings, such as exterior paint and other finishes, and application of asphalt pavement would also produce VOC emissions. Construction emissions can vary substantially from day to day depending on the level of activity; the specific type of operation; and, for dust, the prevailing weather conditions.

For purposes of estimating proposed project emissions, and based on information provided by the Districts, it is assumed that construction of the project would commence in July 2021 and would last approximately 30 months. The analysis contained herein is based on the following subset area schedule assumptions (duration of phases is approximate):

- Demolition of On-Site Buildings: 6 months
- Grading/Trenching: 6 months
- Building Construction: 16 months
- Architectural Coating: 11 days
- Demolition of Existing Pumping Plant: 21 days
- Paving: 11 days

General construction-equipment modeling assumptions are provided in Table 3, Construction Workers, Vendor Trips, and Equipment Use per Day. Default values for equipment mix, horsepower, and load factors provided in CalEEMod were used for all construction equipment. However, a trencher was added to the grading phase to account for infrastructure installation. Buildings to be demolished include 7,500 square-feet of on-site buildings and the 885-square-foot existing pumping plant. Demolition would occur in two different phases. For the analysis, it was generally assumed that heavy-duty construction equipment would be operating at the site 5 days per week, up to a maximum of 8 hours per day. Detailed construction-equipment modeling assumptions are provided in Appendix A.

Table 3. Construction Workers, Vendor Trips, and Equipment Use per Day

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	*Average Daily Vendor Truck Trips*	*Total Haul Truck Trips*	*Equipment Type*	*Quantity*	*Usage Hours*
Demolition of On-Site Buildings	10	0	52	Concrete/Industrial Saws	1	8

Notes: See Appendix A for additional details.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers used during construction of the project. CalEEMod calculates the VOC evaporative emissions from application of surface coatings based on the VOC emissions factor, the building square footage, and the assumed fraction of surface area. VOC rates of 100 grams per liter for interior and exterior coatings were assumed consistent with CalEEMod default values. Table 4, Estimated Maximum Daily Construction Criteria Air Pollutant Emissions, shows the estimated maximum daily construction emissions associated with the construction phase of the proposed project.

Table 4. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

Year	VOCs	NO_X	CO	SO_X	PM_{10}[a]	$PM_{2.5}$[a]
	pounds per day					
2021	0.85	7.39	7.96	0.01	0.56	0.43
2022	1.20	12.27	11.06	0.02	1.19	0.79

Threshold exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Source: SCAQMD 2015.
Notes: VOC = volatile organic compound; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter with a diameter less than or equal to 10 microns (coarse particulate matter); $PM_{2.5}$ = particulate matter with a diameter less than or equal to 2.5 microns (fine particulate matter); SCAQMD = South Coast Air Quality Management District.
See Appendix A for detailed results.
[a] These estimates reflect control of fugitive dust required by SCAQMD Rule 403 (SCAQMD 2005).

As shown in Table 4, the proposed project's maximum daily construction emissions would not exceed the SCAQMD thresholds for any criteria air pollutant.

Operational Emissions

Operation of the existing pumping plant and the proposed project would generate VOC, NO_X, CO, SO_X, PM_{10}, and $PM_{2.5}$ emissions from area sources, energy sources, and mobile sources, which are discussed following. For the existing pumping plant, operational year 2019 was assumed. For the proposed project, operational year 2024 was assumed based upon construction completion.

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use and architectural coatings. Consumer product VOC emissions are estimated in CalEEMod based on the floor area of nonresidential buildings and on the default factor of pounds of VOC per building square foot per day. The CalEEMod default values for consumer products were assumed.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers used during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings, and SCAQMD's Rule 1113, Architectural Coatings, governs the VOC content for interior and exterior coatings. As a conservative measure, CalEEMod default VOC contents were assumed for the reapplication of architectural coatings.

Landscape maintenance includes fuel combustion emissions from equipment such as blowers, trimmers, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. For the SCAB, the average annual number of summer days is estimated at 250 days (CAPCOA 2017).

Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage (non-hearth). Based on input from the Districts, no natural gas usage would be required for the proposed project. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHGs in CalEEMod, since criteria pollutant emissions occur at the power plant, which is typically off site.

Mobile Sources

The existing pumping plant and the proposed project both require daily visitation by a pumping plant operator. CalEEMod was used to estimate emissions from proposed vehicular sources (refer to Appendix A). CalEEMod default data, including trip characteristics, emissions factors, and trip distances, were conservatively used for the model inputs. Emission factors representing the vehicle mix and emissions for 2019 and 2024 were used to estimate emissions associated with vehicular sources for the

existing pumping plant and project, respectively. The 2024 operational year represents the first year of project build-out and would represent maximum daily operational emissions.

Stationary Sources

Testing of the 150 kW emergency generator at the existing pumping plant and the proposed 350 kW emergency generator were modeled using CalEEMod, assuming a 1-hour testing duration per day per month. The default emission rates for the existing emergency generator were adjusted based on the age of the equipment (model year 1988) and represent a Tier 1 engine. For the proposed generator, CalEEMod default emission rates were used, which represent a Tier 3 engine.

Table 5, Estimated Maximum Daily Operational Criteria Air Pollutant Emissions, presents the maximum daily emissions associated with operation of the existing pumping plant and the proposed project. The values shown are the maximum summer or winter daily emissions results from CalEEMod. Complete details of the emissions calculations are provided in Appendix A.

Table 5. Estimated Maximum Daily Operational Criteria Air Pollutant Emissions

Emission Source	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$

Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes:
VOC = volatile organic compound; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter with a diameter less than or equal to 10 microns (coarse particulate matter); $PM_{2.5}$ = particulate matter with a diameter less than or equal to 2.5 microns (fine particulate matter); SCAQMD = South Coast Air Quality Management District.
See Appendix A for complete results.
Numbers in parentheses represent negative numbers (i.e., a reduction in emissions for the project as compared to the existing pump station). Values of "<0.01" indicate that the estimated emissions are less than two decimals. The values shown are the maximum summer or winter daily emissions results from CalEEMod. The total values may not add up exactly due to rounding.

As shown in Table 5, the maximum net increase in daily operational emissions of VOC, NO_X, CO, SO_X, PM_{10}, and $PM_{2.5}$ generated by the proposed project would not exceed the SCAQMD's significance thresholds.

Air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and SCAQMD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level thresholds of significance for criteria pollutants are used in the determination of whether a project's individual emissions would have a cumulatively considerable contribution on air quality. If a project's emissions would exceed the SCAQMD significance thresholds, it would be considered to have a cumulatively considerable contribution. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant (SCAQMD 2003).

As discussed previously, the SCAB has been designated as a federal nonattainment area for O_3 and $PM_{2.5}$, and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SCAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operational activities of the proposed project would generate VOC and NO_X emissions (precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$. However, as indicated in Tables 4 and 5, project-generated emissions would be minimal and would not exceed the SCAQMD emission-based significance thresholds for VOCs, NO_X, PM_{10}, or $PM_{2.5}$.

Cumulative localized impacts would potentially occur if a project were to occur concurrently with another off-site project. Schedules for potential future projects near the project area are currently unknown; therefore, potential impacts associated with two or more simultaneous projects would be considered speculative.[4] However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by SCAQMD. Cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SCAQMD Rule 403, Fugitive Dust, which sets forth general and specific requirements for all sites in the SCAQMD.

Therefore, the proposed project would not result in a cumulatively considerable increase in emissions of nonattainment pollutants, and impacts would be less than significant during construction and operation.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

Less-Than-Significant Impact. The proposed project would not expose sensitive receptors to substantial pollutant concentrations as evaluated below.

Sensitive Receptors

Sensitive receptors are those individuals more susceptible to the effects of air pollution than the population at large. People most likely to be affected by air pollution include children, the elderly, and people with cardiovascular and chronic respiratory diseases. According to SCAQMD, sensitive receptors include sites such as residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993).

[4] The CEQA Guidelines state that if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145).

There are existing residences located to the southeast and to the west of the project site, with the nearest in each direction at approximately 220 feet and 370 feet, respectively.

Localized Significance Thresholds

SCAQMD recommends a localized significance threshold (LST) analysis to evaluate localized air quality impacts to sensitive receptors in the immediate vicinity of the proposed project resulting from project activities. The impacts were analyzed using methods consistent with those in SCAQMD's Final Localized Significance Threshold Methodology (SCAQMD 2008a). The proposed project is located within Source Receptor Area 3, Southwest Los Angeles County Coastal. This analysis applies the SCAQMD LST values for a 1-acre site within Source Receptor Area 3 with a receptor distance of 50 meters (164 feet), which is conservative given that daily disturbed area for the proposed project would be less than 1 acre and the nearest sensitive receptor would be 220 feet away.

Project construction activities would result in temporary sources of on-site criteria air pollutant emissions associated with off-road equipment exhaust and fugitive dust generation. According to the Final Localized Significance Threshold Methodology, "off-site mobile emissions from the project should not be included in the emissions compared to the LSTs" (SCAQMD 2008a). Trucks and worker trips associated with the proposed project are not expected to cause substantial air quality impacts to sensitive receptors along off-site roadways since emissions would be relatively brief in nature and would cease once the vehicles pass through the main streets. Therefore, off-site emissions from trucks and worker vehicle trips are not included in the LST analysis. The maximum daily on-site emissions generated by construction of the proposed project in each construction year are presented in Table 6, Construction Localized Significance Thresholds Analysis, and compared to the SCAQMD localized significance criteria for Source Receptor Area 3 to determine whether project-generated on-site emissions would result in potential LST impacts.

Table 6. Construction Localized Significance Thresholds Analysis

Year	NO_2	CO	PM_{10}	$PM_{2.5}$
	pounds per day (on site)[a]			
2021	7.25	7.57	0.44	0.39
2022	9.79	10.07	0.90	0.71
2023	6.42	7.10	0.32	0.29
Maximum	*9.79*	*10.07*	*0.90*	*0.71*
SCAQMD LST Criteria	*93*	*785*	*14*	*5*
Threshold Exceeded?	**No**	**No**	**No**	**No**

Source: SCAQMD 2008a.
Notes: NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = particulate matter with a diameter less than or equal to 10 microns (coarse particulate matter); $PM_{2.5}$ = particulate matter with a diameter less than or equal to 2.5 microns (fine particulate matter); SCAQMD = South Coast Air Quality Management District; LST = localized significance threshold.
See Appendix A for detailed results. These estimates reflect control of fugitive dust required by SCAQMD Rule 403 (SCAQMD 2005).
[a] Localized significance thresholds are shown for a 1-acre disturbed area corresponding to a distance to a sensitive receptor of 50 meters in Source Receptor Area 3, Southwest Los Angeles County Coastal.

As shown in Table 6, proposed construction activities would not generate emissions in excess of site-specific LSTs; therefore, localized impacts of the proposed project would be less than significant.

CO Hotspots

Traffic-congested roadways and intersections have the potential to generate localized high levels of CO. Localized areas where ambient concentrations exceed federal and/or state standards for CO are termed "CO hotspots." The transport of CO is extremely limited, as it disperses rapidly with distance from the source. Under certain extreme meteorological conditions, however, CO concentrations near a congested roadway or intersection may reach unhealthy levels, affecting sensitive receptors. Typically, high CO concentrations are associated with severely congested intersections operating at an unacceptable level of service (LOS) (LOS E or worse is unacceptable). Projects contributing to adverse traffic impacts may result in the formation of a CO hotspot. Additional analysis of CO hotspot impacts would be conducted if a project would result in a significant impact or contribute to an adverse traffic impact at a signalized intersection that would potentially subject sensitive receptors to CO hotspots.

Code of Federal Regulations title 40, section 93.123(c)(5), Procedures for Determining Localized CO, PM_{10}, and $PM_{2.5}$ Concentrations (Hot-Spot Analysis), states that "CO, PM_{10}, and $PM_{2.5}$ hot-spot analyses are not required to consider construction-related activities, which cause temporary increases in emissions. Each site that is affected by construction-related activities shall be considered separately, using established 'Guideline' methods. Temporary increases are defined as those which occur only during the construction phase and last 5 years or less at any individual site." Although project construction would involve on-road vehicle trips from trucks and workers during construction, construction activities would last approximately 30 months and would not require a project-level construction hotspot analysis. Furthermore, because the proposed project would not result in an increase in long-term operational vehicular trips, an operational CO hotspot evaluation also is not required.

Accordingly, the proposed project would not generate traffic that would contribute to potential adverse traffic impacts that may result in the formation of CO hotspots. In addition, because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SCAB is steadily decreasing. Based on these considerations, the proposed project would result in a less-than-significant impact to air quality from potential CO hotspots.

Toxic Air Contaminants

TACs are defined as substances that may cause or contribute to an increase in deaths or in serious illness, or that may pose a present or potential hazard to human health. As discussed under the LST analysis, the nearest sensitive receptors to the proposed project are residences located approximately 220 feet from the proposed construction area. Health effects from carcinogenic air toxics are usually described in terms of cancer risk. SCAQMD recommends an incremental cancer risk threshold of 10 in 1 million. "Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period will contract cancer based on the use of standard California Office of Environmental Health Hazard Assessment risk-assessment methodology (OEHHA 2015). In addition, some TACs have non-carcinogenic effects. SCAQMD recommends a Hazard Index of 1 or more for acute (short-term) and chronic (long-term) non-carcinogenic effects.[5] The TAC that would potentially be emitted during construction activities associated with development of the proposed project would be diesel particulate matter.

[5] Non-cancer adverse health risks are measured against a hazard index, which is defined as the ratio of the predicted incremental exposure concentrations of the various non-carcinogens from the proposed project to published reference exposure levels that can cause adverse health effects.

Diesel particulate matter emissions would be emitted from heavy equipment operations and heavy-duty trucks. Heavy-duty construction equipment is subject to a CARB Airborne Toxics Control Measure for diesel construction equipment to reduce diesel particulate emissions. As described for the LST analysis, PM_{10} (representative of diesel particulate matter) exposure would be minimal. According to the Office of Environmental Health Hazard Assessment, health risk assessments, which determine the exposure of sensitive receptors to toxic emissions, should be based on a 30-year exposure period for the maximally exposed individual resident; however, such assessments should be limited to the period and duration of activities associated with the proposed project. The duration of the proposed construction activities would only constitute a small percentage of the total 30-year exposure period. The construction period for the proposed project would be approximately 30 months, after which construction-related TAC emissions would cease. Because of this relatively short period of exposure and minimal particulate emissions on site, TACs generated during construction would not be expected to result in concentrations causing significant health risks.

Regarding long-term sources of TAC emissions, the proposed project would result in the replacement of the existing older 150 kW emergency diesel generator with a newer 350 kW emergency diesel generator. Although the proposed project includes a generator with more horsepower, the newer generator would result in a reduction in PM_{10} emissions (which is a surrogate for diesel exhaust), as depicted in Table 5, Estimated Maximum Daily Operational Criteria Air Pollutant Emissions. Thus, the proposed project would result in a reduction in long-term TAC emissions.

Based on these considerations, the proposed project would not result in substantial TAC exposure to sensitive receptors in the vicinity of the proposed project, and impacts would be less than significant.

Health Impacts of Criteria Air Pollutants

Operation of the proposed project would generate criteria air pollutant emissions; however, the proposed project would not exceed the SCAQMD mass-emission thresholds.

The SCAB is designated as nonattainment for O_3 for the NAAQS and CAAQS. Thus, existing O_3 levels in the SCAB are at unhealthy levels during certain periods. The health effects associated with O_3 generally result in reduced lung function. Because the proposed project would not involve activities that would result in O_3 precursor emissions (i.e., VOCs or NO_X) that would exceed the SCAQMD thresholds, as shown in Tables 4 and 5, the proposed project is not anticipated to substantially contribute to regional O_3 concentrations and their associated health impacts during construction or operation.

In addition to O_3, NO_X emissions contribute to potential exceedances of the NAAQS and CAAQS for NO_2. Exposure to NO_2 and NO_X can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections. As shown in Tables 4 and 5, the construction and operation of the proposed project would not exceed the SCAQMD NO_X threshold, and existing ambient NO_2 concentrations would be below the NAAQS and CAAQS. Thus, the proposed project is not expected to result in exceedances of the NO_2 standards or contribute to associated health effects.

CO tends to be a localized impact associated with congested intersections. In terms of adverse health effects, CO competes with oxygen, often replacing it in the blood, thereby reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can include dizziness, fatigue, and impairment of central nervous system functions. CO hotspots were discussed previously as a less-than-significant impact. Thus, the proposed project's CO emissions would not contribute to the health effects associated with this pollutant.

The SCAB is designated as a nonattainment area for PM_{10} under the CAAQS and for $PM_{2.5}$ under the NAAQS and CAAQS. Particulate matter contains microscopic solids or liquid droplets that are so small that they can be transmitted into the lungs and cause serious health problems. Particulate matter exposure has been linked to a variety of problems, including premature death in people with heart or lung disease; nonfatal heart attacks; irregular heartbeat; aggravated asthma; decreased lung function; and increased respiratory symptoms such as irritation of the airways, coughing, or difficulty breathing (EPA n.d.). As with O_3 and NO_X, and as shown in Tables 4 and 5, the proposed project would not generate emissions of PM_{10} or $PM_{2.5}$ that would exceed the SCAQMD's thresholds. Accordingly, the proposed project's PM_{10} and $PM_{2.5}$ emissions are not expected to cause an increase in related health effects for this pollutant.

In summary, the proposed project would not make a potentially significant contribution to regional concentrations of nonattainment pollutants, and would not result in a significant contribution to the adverse health impacts associated with those pollutants. Therefore, impacts would be less than significant.

d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less-Than-Significant Impact. The occurrence and severity of potential odor impacts depend on numerous factors. The nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receiving location each contributes to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying, cause distress, and generate citizen complaints.

SCAQMD provides a list of land uses associated with odor concerns, which include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (SCAQMD 1993). The proposed project would include replacement of an existing pumping plant, which is not anticipated to generate new odors or increase emissions of odors, it is not one of the types of land uses identified in SCAQMD's screening criteria.

During project construction, exhaust from equipment may produce discernible odors typical of most construction sites. Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from the tailpipes of construction equipment. However, such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Accordingly, impacts associated with odors during construction would be less than significant.

3.4 Biological Resources

a) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

No Impact. The project site is located in a developed part of the City and is surrounded by a predominantly urbanized mix of land uses, including commercial and residential. Open space resources within the City include parks and other recreational facilities, such as public school facilities and ball fields; landscaped medians; open area occupied by utilities, such as flood control channels and utility

easements; and private recreational facilities (City of Gardena 2006a). The nearest open space areas include the Dominguez Channel and the landscaped median located on Artesia Boulevard. However, no native habitat is located on the project site or in the immediately surrounding area. On-site plant species are limited to non-native grasses and one tree located to the east of the existing plant superstructure. These non-native, ornamental plant species form a non-cohesive plant community that is not known to support any candidate, sensitive, or special-status plant species. Based on the developed nature of the project site and surrounding area, wildlife species that could occur on site include common species typically found in urbanized settings, such as house sparrow (*Passer domesticus*), mourning dove (*Zenaida macroura*), and western fence lizard (*Sceloporus occidentalis*). Based on specific habitat requirements, none of these, or any other wildlife species that can reasonably be expected to occur on the project site, is a candidate, sensitive, or special-status wildlife species.

Because of the highly disturbed nature of the project site and the auto-related commercial activity around the site, it is unlikely that the existing trees located east of the existing superstructure would provide desirable nesting opportunities for bird/raptor species, especially considering that more-suitable nesting options likely occur within the broader project area. Therefore, no impacts associated with candidate, sensitive, or special-status species would occur.

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

No Impact. The project site is located entirely on developed and disturbed land. No natural vegetation communities are present within the project site. Therefore, no impacts associated with riparian or sensitive vegetation communities would occur.

c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact. A concrete flood control channel, the Dominguez Channel, is located approximately 160 feet to the east of the project site. The proposed project would be subject to typical restrictions (e.g., best management practices [BMPs]) and requirements that address erosion and runoff, including those of the Clean Water Act and National Pollutant Discharge Elimination System (NPDES) permit. Compliance with existing regulations would ensure that construction activities would not adversely affect jurisdictional waters. Additionally, all construction activities would be limited to developed and disturbed land with appropriate setbacks from the nearby channel. Further, a review of the U.S. Fish and Wildlife Service National Wetlands Inventory did not identify the project site as containing any blue-line streams or wetland habitats (USFWS 2019). Because of the urbanized nature of the project site, as well as the absence of wetlands located on site and compliance with regulations, the proposed project would not result in substantial adverse effect on state or federally protected wetlands. Therefore, there would be no potential impacts to jurisdictional waters.

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

No Impact. Wildlife corridors are linear, connected areas of natural open space that provide avenues for migration of animals. Habitat linkages are small patches that join larger blocks of habitat and help reduce the adverse effects of habitat fragmentation; they may be continuous habitat or discrete habitat islands that function as stepping stones for wildlife dispersal.

The project site is entirely developed, disturbed, and contains a very small patch of non-native grasses and one tree located to the east of the existing plant superstructure. Although some local movement of wildlife is expected to occur within the City, the City of Gardena is not recognized as an existing or proposed Significant Ecological Area that links migratory populations, as designated by the County of Los Angeles (Department of Regional Planning 2015).

The project site is located within a highly urbanized area and would not interfere with the movement of any native residents, migratory fish, or wildlife species. Therefore, no impacts associated with wildlife movement or wildlife corridors would occur.

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

No Impact. The City's Municipal Code chapter 13.60.080 requires a trimming permit, tree-removal permit, and/or a tree-planting permit for cutting, trimming, pruning, planting, removing, injuring, or interfering with any tree, shrub, or plant upon any street or public place in the City. The only trees located on the project site are within existing property owned by the Districts; therefore, any removal of existing trees would not conflict with chapter 13.60.080 of the municipal code (City of Gardena 2018). Therefore, no impacts associated with local policies or ordinances protecting biological resources would occur.

f) Would the project conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan?

No Impact. According to California Department of Fish and Wildlife's plan area boundaries for natural community conservation plans/habitat conservation plans, the project site is not located within an adopted natural community conservation plan/habitat conservation plan area (CDFW 2017). The City has adopted a conservation plan as part of the general plan, which includes goals and policies related to the Willows Wetlands, groundwater resources, solid waste, energy resources, and cultural resources (City of Gardena 2006c). Implementation of the proposed project would not conflict with these goals and policies. Therefore, no impacts associated with an adopted conservation plan would occur.

3.5 Cultural Resources

The following analysis is based on the cultural resources technical report prepared by Dudek in March 2019, and included as Appendix B. The report involved the completion of a California Historical Resources Information System (CHRIS) records search, outreach with the Native American Heritage Commission (NAHC) and local Native

American individuals and/or tribal organizations, a pedestrian survey of the project area for built environment resources, and recordation and evaluation of three built environment resources for historical significance.

a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

Less-Than-Significant Impact. As part of preparation for the cultural resources technical report, a CHRIS records search from the South Central Coastal Information Center, which houses cultural resources records for Los Angeles County, was requested. The CHRIS search included any previously recorded cultural resources and investigations within a 1-mile radius of the project site. Additional consulted sources included historical maps of the project site; the National Register of Historic Places (NRHP); the California Register of Historical Resources (CRHR); the California Historic Property Data File; and the lists of California State Historical Landmarks, California Points of Historical Interest, and the Archaeological Determinations of Eligibility.

Results of the CHRIS search indicate that 27 previously conducted studies (1974 through 2013) were identified within the 1-mile records search radius. One of the studies, LA-10333 overlaps the project site, and one study, LA- 10106, is directly adjacent to the southern border of the project site. Neither of these studies yielded cultural resources or sites. Additionally, the CHRIS records search identified four previously recorded cultural resources within a 1-mile radius of the project site; however, none of these cultural resources is located within the project site. Three of the resources are historic built-environment resources—Dominguez Slough (P-19-177369), Gardena High School (P-19-190006), and a steel lattice transmission tower (P-19-190646)—and one resource is a historic refuse deposit dating from the 1930s to the 1960s (P-19-004644). None of these resources has been found eligible for listing on the NRHP, CRHR, or local designations).

The cultural resources report also involved a field survey of the project site, conducted on January 8, 2019. During the survey, all accessible portions of the buildings that were visible from the public right-of-way were documented. The surveyed sources consisted of three buildings on the north side of Artesia Boulevard: the Gardena Pumping Plant at 1919 West Artesia Boulevard (APN 4094-007-903), the Majestic Lighting building at 1923 West Artesia Boulevard (APN 4094-007-005), and the E-S Technical Motorsports building at 1931 West Artesia Boulevard (APN 4094-007-004).

As defined by the CEQA Guidelines (14 CCR 15000 et seq.), a "historical resource" is considered to be a resource that is listed in or eligible for listing in the NRHP or CRHR, has been identified as significant in a historical resource survey, or is listed on a local register of historical resources.

The criteria for listing resources in the CRHR were developed to be in accordance with previously established criteria developed for listing in the NRHP. Thus, the criteria listed as follows are expressed in accordance with the NRHP criteria. According to Public Resources Code Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity" and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history.

Under CEQA, a project may have a significant effect on the environment if it causes "a substantial adverse change in the significance of an historical resource" (Public Resources Code Section 21084.1; 14 CCR 15064.5(b)). If a site is listed or eligible for listing in the CRHR, or included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of Public Resources Code section 5024.1(q)), it is a historical resource and is presumed to be historically or culturally significant for the purposes of CEQA (Public Resources Code Section 21084.1; 14 CCR 15064.5(a)). The Gardena Pumping Plant, the Majestic Lighting building, and the E-S Technical Motorsports building were evaluated in consideration of NRHP/CRHR designation criteria. The significance evaluation for each building is as follows:

Gardena Pumping Plant

NRHP/CRHR Statement of Significance

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research identified that the original 1928 Gardena Pumping Plant was likely designed and built during the initial Districts' campaign to build out Sanitation District No. 5 infrastructure, including sewer trunk lines, branch lines, wells, and other pumping stations. District No. 5's infrastructure was built concurrently with infrastructure for District Nos. 1, 2, 3, 4, and 8. This was part of a Los Angeles County–wide push for sanitation infrastructure in the early twentieth century to accommodate population growth in the proposed sanitation districts and to promote or entice industrial development to establish in Los Angeles County. However, the role of the Gardena Pumping Plant in this campaign is trivial. The subject pumping plant was one of several plants working as part of a larger infrastructure system to keep sewage moving to the outfall at White's Point. Moreover, the building has undergone several alterations and a large addition from 1960 that have diminished its integrity and its ability to convey an association with the 1925–1930 Sanitation District infrastructure project. Therefore, the Gardena Pumping Plant does not appear eligible under NRHP/CRHR Criterion A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, the Gardena Pumping Plant does not appear eligible under NRHP/CRHR Criterion B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The Gardena Pumping Plant is not a distinctive or remarkable example of the early twentieth century commercial style, and it has had several major alterations, including new doors, window infill, and a 1960 addition clearly visible from the main elevation. It retains some minor character-defining features such as the decorative basket-weave brickwork on the 1928 building, and the belt course and dentil band below the parapet. A Districts engineer designed the Gardena Pumping Plant, but the name of the designer could not be determined from the engineering plans. The building does not possess high artistic value and is not a significant or distinguishable entity. For all of these reasons, the Gardena Pumping Plant does not appear eligible under NRHP/CRHR Criterion C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that the Gardena Pumping Plant has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, the Gardena Pumping Plant is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: The Gardena Pumping Plant is sited on the original location of construction in its original orientation. Therefore, the Gardena Pumping Plant retains integrity of location.

Design: The Gardena Pumping Plant was subjected to several extensive exterior alterations over time that compromise its integrity of design, including a 1960 addition visible from the main elevation, rendered in a different style with window infill on the west, north, and east elevations; a new door; and arched entry infill for the 1928 building. Therefore, the Gardena Pumping Plant does not retain integrity of design.

Setting: The setting of the Gardena Pumping Plant has changed significantly since the original 1928 building was built, including the slow replacement of orchards and agricultural fields with small-scale industrial and commercial buildings and complete urbanization of the Gardena Valley area. Therefore, Gardena Pumping Plant does not retain integrity of setting.

Materials: Numerous alterations to the Gardena Pumping Plant have compromised the property's material integrity, including a 1960 addition, window infill, and new doors. Even though brick material was used for the 1960 addition and window infill, there has been material loss of all original fenestration. Therefore, Gardena Pumping Plant no longer retains integrity of materials.

Workmanship: Similar to the issue with materials, the physical evidence of a craftsman's skills in constructing the original Gardena Pumping Plant building was compromised by the alterations and additions. Therefore, the Gardena Pumping Plant no longer retains its integrity of workmanship.

Feeling: The Gardena Pumping Plant does not convey the feeling of an early twentieth century utility building, since subsequent alterations and additions negatively affected the building's ability to convey this feeling. Therefore, the Gardena Pumping Plant no longer retains integrity of feeling.

Association: An important historical association between the Gardena Pumping Plant and efforts to introduce comprehensive sewerage throughout Los Angeles County was noted, but subsequent alterations and additions have diminished this historical association. Therefore, the Gardena Pumping Plant no longer retains integrity of association.

In summary, the Gardena Pumping Plant appears not to be eligible under all NRHP and CRHR designation criteria. Further, the Gardena Pumping Plant only retains integrity of location and, therefore, does not maintain the requisite integrity to warrant listing in the NRHP or CRHR.

Majestic Lighting

NRHP/CRHR Statement of Significance

In consideration of the project site's history and requisite integrity, 1923 West Artesia Boulevard is recommended not to be eligible for listing in the NRHP or CRHR based on the following significance evaluation.

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not identify any associations with events that have made a significant contribution to the broad patterns of local or regional history. Neither 1923 West Artesia Boulevard nor its current tenant, Majestic Lighting, is associated with any locally important events in the City of Gardena. Because of a lack of significant associations with events important to history, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criterion A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criterion B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

1923 West Artesia Boulevard is not a distinctive or remarkable example of the Mid-Century Modern architectural style. H.L. Standefer, the architect listed on the building plans, is not identified as a master architect. Further, the building does not possess high artistic value and is not eligible as a contributor to a historic district. For all of these reasons, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criterion C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that 1923 West Artesia Boulevard has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, 1923 West Artesia Boulevard is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: 1923 West Artesia Boulevard is sited on the original location of construction in its original orientation. Therefore, 1923 West Artesia Boulevard retains integrity of location.

Design: 1923 West Artesia Boulevard has not had significant, visible alterations over time that have compromised its integrity of design. It has not changed its layout, architectural style, or decoration since it was constructed in 1957. Therefore, 1923 West Artesia Boulevard retains integrity of design.

Setting: The setting of 1923 West Artesia Boulevard remains relatively unchanged since its construction in 1957. The north side of West Artesia Boulevard was populated between 1954 and 1960, and the size, massing, scale, and types of businesses have not changed in subsequent years. Therefore, 1923 West Artesia Boulevard retains integrity of setting.

Materials: 1923 West Artesia Boulevard has not had significant, visible exterior alterations over time that have compromised its integrity of materials. This is corroborated by the list of alterations on file with the City of Gardena's Community Development Department. Therefore, 1923 West Artesia Boulevard retains integrity of materials.

Workmanship: 1923 West Artesia Boulevard has not been altered on the exterior. Evidence of original workmanship, including the stone veneer decoration, are still present. Therefore, 1923 West Artesia Boulevard retains integrity of workmanship.

Feeling: 1923 West Artesia Boulevard retains integrity and still successfully conveys the feeling of being a 1950s Mid-Century Modern small-scale commercial building, and it has not experienced significant alterations that would significantly impact the building's ability to convey this feeling. Therefore, the 1923 West Artesia Boulevard retains integrity of feeling.

Association: No important historical associations with events or people were identified for the subject property.

In summary, 1923 West Artesia Boulevard retains integrity, including integrity of location, design, setting, materials, workmanship, and feeling. However, the subject property appears not to be eligible under all NRHP and CRHR designation criteria for lack of important associations and lack of distinctive characteristics of a style or a master architect.

E-S Technical Motorsports

NRHP/CRHR Statement of Significance

In consideration of the project site's history and requisite integrity, 1931 West Artesia Boulevard is recommended not eligible for listing in the NRHP or CRHR based on the following significance evaluation.

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not identify any associations with events that have made a significant contribution to the broad patterns of local or regional history. Neither 1931 West Artesia Boulevard, its current tenant, E-S Technical Motorsports, nor previous tenants are associated with any locally important events in the City of Gardena. Because of a lack of significant associations with events important to history, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criterion A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criterion B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The building at 1931 West Artesia Boulevard is not a distinctive or remarkable example of the Mid-Century Modern architectural style. The building also does not have an identified architect or a master architect. Further, the building does not possess high artistic value and is not eligible as a contributor to a historic district. For all of these reasons, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criterion C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that 1931 West Artesia Boulevard has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, 1931 West Artesia Boulevard is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: 1931 West Artesia Boulevard is sited on the original location of construction in its original orientation. Therefore, 1931 West Artesia Boulevard retains integrity of location.

Design: 1931 West Artesia Boulevard has not had significant, visible alterations over time that have compromised its integrity of design. It has not changed its layout, architectural style, or decoration since it was constructed in 1954. Therefore, 1931 West Artesia Boulevard retains integrity of design.

Setting: The setting of 1931 West Artesia Boulevard remains relatively unchanged since its construction in 1954. The north side of West Artesia Boulevard, between Gramercy Place and the Dominguez Channel, was mostly agricultural land before becoming populated with small-scale commercial buildings between 1954 and 1960. The size, massing, scale, and types of businesses have not changed in subsequent years. Therefore, 1931 West Artesia Boulevard retains integrity of setting.

Materials: 1931 West Artesia Boulevard has not had significant, visible exterior alterations over time that have compromised its integrity of materials. This is corroborated by the list of alterations on file with the City of Gardena's Community Development Department. Therefore, 1931 West Artesia Boulevard retains integrity of materials.

Workmanship: 1931 West Artesia Boulevard has not been altered on the exterior. Therefore, 1931 West Artesia Boulevard retains integrity of workmanship.

Feeling: 1931 West Artesia Boulevard still successfully conveys the feeling of being a 1950s Mid-Century Modern small-scale commercial building, and it has not experienced significant alterations that would significantly impact the building's ability to convey this feeling. Therefore, 1931 West Artesia Boulevard retains integrity of feeling.

Association: No important historical associations with events or people were identified for 1931 West Artesia Boulevard.

In summary, 1931 West Artesia Boulevard retains integrity, including integrity of location, design, setting, materials, workmanship, and feeling. However, the subject property appears not to be eligible under all NRHP and CRHR designation criteria for lack of important associations and lack of distinctive characteristics of a style or a master architect.

Summary

As a result of the background research, field survey, and property significance evaluations, the Gardena Pumping Plant, the 1923 West Artesia Boulevard, and the 1931 West Artesia Boulevard buildings appear not eligible for the NRHP or CRHR because of a lack of significant historical associations, a lack of architectural merit, and/or compromised integrity. Therefore, these properties are not considered historical resources for the purposes of CEQA. Impacts associated with historical resources would be less than significant.

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Less-Than-Significant Impact With Mitigation Incorporated. As discussed previously in Section 3.5(a), a CHRIS records search from the South Central Coastal Information Center, which houses cultural resources records for Los Angeles County, was performed. The CHRIS search included any previously recorded cultural resources and investigations within a 1-mile radius of the project site. Results of the CHRIS search indicate that 27 previously conducted studies (1974 through 2013) were identified within the 1-mile records search radius. One of the studies, LA-10333, overlaps the project site, and one study, LA- 10106, is directly adjacent to the southern border of the project site. Neither of these studies yielded cultural resources or sites. Additionally, the CHRIS records search identified four previously recorded cultural resources within a 1-mile radius of the project site; however, none of these cultural resources are located within the project site.

In addition to the CHRIS records search, a Sacred Lands File search was conducted for the project site and surrounding area by NAHC to determine presence of prehistoric cultural resources within the project area. NAHC responded on January 25, 2019, indicating that the search failed to indicate the presence of Native American cultural resources for the project site. However, because negative results do not preclude the presence of Native American cultural resources within the area, NAHC also suggested contacting Native American groups and/or individuals who may have knowledge of cultural resources in the project area, and provided a list of five such interested parties. Letters regarding the proposed project were sent on January 29, 2019 to all five individuals listed on the NAHC consultation list.[6]

No archaeological resources were identified within the project site as a result of the records search or NAHC Sacred Lands File search. However, it is always possible that intact archaeological deposits are present at subsurface levels. For this reason, the project site should be treated as potentially sensitive for archaeological resources. Therefore, mitigation measures MM-CUL-1 and MM-CUL-2 are recommended to reduce potential impacts to unanticipated archaeological resources to less-than-significant levels.

[6] This outreach was conducted for informational purposes only and did not constitute formal government-to-government consultation as specified by AB 52.

MM-CUL-1 To reduce potential impacts to unanticipated cultural resources during project implementation, all construction personnel shall undergo Worker Environmental Awareness Program (WEAP) training to ensure that any unanticipated archaeological discoveries are treated appropriately. The WEAP training shall provide specific details on the kinds of archaeological materials that may be identified during project implementation.

MM-CUL-2 In the event that archaeological resources (sites, features, or artifacts) are exposed during construction activities for the proposed project, all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist who meets the Secretary of the Interior's Professional Qualification Standards can evaluate the significance of the find and determine whether or not additional study is warranted. Should it be required, temporary flagging may be installed around a resource to avoid any disturbances from construction equipment. Depending on the significance of the find under CEQA (14 California Code of Regulations section 15064.5(f); Public Resources Code section 21082), the archaeologist may record the find to appropriate standards (thereby addressing any data potential) and allow work to continue. If the archaeologist observes the discovery to be potentially significant under CEQA, additional treatment may be required.

With the incorporation of mitigation, impacts associated with archaeological resources would be less than significant.

c) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Less-Than-Significant Impact. There are no previously recorded cultural resources on the project site. Because the project site has been previously disturbed, construction activities such as grading are unlikely to uncover previously unknown archaeological resources. Nonetheless, in accordance with California Health and Safety Code Section 7050.5, if potential human remains are found, the lead agency staff and the county coroner must be immediately notified of the discovery. The coroner would provide a determination within 48 hours of notification. No further excavation or disturbance of the identified material, or any material reasonably suspected to overlie additional remains, may occur until a determination has been made. If the County Coroner determines that the remains are, or are believed to be, Native American, the coroner would notify the NAHC within 24 hours. In accordance with Public Resources Code Section 5097.98, the NAHC must immediately notify those persons it believes to be the Most Likely Descendant from the deceased Native American. Within 48 hours of this notification, the Most Likely Descendant would recommend to the lead agency the preferred treatment of the remains and associated grave goods. Therefore, impacts would be less than significant.

3.6 Energy

a) Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Construction

Less-Than-Significant Impact. Construction of the proposed project would require the use of electric power for as-necessary lighting and electronic equipment. The amount of electricity used during construction would be minimal because typical energy demand stems from the use of electrically powered equipment. This electricity demand would be temporary and would cease upon completion of construction; therefore, the proposed project would not adversely impact the available electricity supply. During construction, natural gas would typically not be consumed on the project site. The majority of the energy used during construction would be from petroleum.

Petroleum would be consumed throughout construction of the proposed project. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction, and VMT associated with the transportation of construction materials and construction worker commutes also would result in petroleum consumption. However, the proposed project would be required to comply with CARB's Airborne Toxics Control Measure, which restricts heavy-duty diesel vehicle idling time to 5 minutes. Additionally, the petroleum used during construction would be temporary and minimal, and would not be wasteful or inefficient. Therefore, short-term construction impacts associated with energy consumption would be less than significant.

Long-Term Operational Impacts

Less-Than-Significant Impact. The proposed project involves the construction of a consolidated pumping plant to address the existing maintenance issues associated with the existing pumping plant, which currently operates as two functionally separate pumping plants. Regarding energy use, the proposed project would result in similar operations and similar energy demand as under existing conditions. Because the proposed project would consolidate the operations of the pumping plant from two pumps to one pump, the energy required for the proposed project would be less than that currently required. In addition, the pumping plant superstructure would be constructed in accordance with CCR Title 24, Part 6, Energy Efficiency Standards for Residential and Nonresidential Buildings. This would reduce energy consumption for lighting and other energy-using fixtures. Therefore, the proposed project would have a less-than-significant impact upon energy consumption.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

No Impact. As discussed in Section 3.6(a), the proposed project would not result in wasteful, inefficient, and unnecessary consumption of energy during construction or operation. During construction, the proposed project would comply with CARB's Airborne Toxics Control Measure, which restricts heavy-duty diesel vehicle idling time to 5 minutes. Additionally, energy use during construction would be minimal and temporary. The proposed project would be operated to comply with 2016 Title 24 standards to reduce energy-use in nonresidential structures. Therefore, no impacts associated with the potential of the project to conflict with a state or local renewable energy or energy efficiency plan would occur.

3.7 Geology and Soils

a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

No Impact. The project site is not located within an Alquist-Priolo Earthquake Fault Zone (DOC 2019). There are no known active faults projecting toward or extending across the project site. The City's Public Safety Plan identifies the only Alquist-Priolo Earthquake Fault Zone in the northeast portion of the City near El Segundo Boulevard and Vernon Avenue, approximately 3 miles to the northeast of the project site (City of Gardena 2006d). Therefore, the proposed project would not result in impacts associated with known earthquake faults. No impact would occur.

ii) Strong seismic ground shaking?

Less-Than-Significant Impact. Similar to other areas located in the seismically active Southern California region, the City is susceptible to strong ground shaking during an earthquake. During the life of the proposed project, seismic activity associated with active faults can be expected to generate moderate to strong ground shaking at the project site. According to the City's Public Safety Plan, faults that could affect the City include the regional San Andreas and San Jacinto faults and the local Newport-Inglewood, Palos Verdes, Whittier Elsinore, Sierra Madre-Cucamonga, San Fernando, and Raymond Hill fault systems (City of Gardena 2006d). However, the project site is not located within an Alquist-Priolo Earthquake Fault Zone, and the site would not be affected more than any other area in this seismic region.

Additionally, the proposed project would be designed in accordance with all applicable provisions established in the current California Building Code (CBC). Appropriate measures to mitigate and minimize the effects of earthquakes and other geotechnical hazards are included in the CBC, with specific provisions pertaining to seismic load and design. The design and construction of the proposed project in accordance with the CBC would minimize the adverse effects of strong ground shaking to the greatest degree feasible during an earthquake. Compliance with these requirements would reduce the potential risk to both people and structures with respect to strong seismic ground shaking. Therefore, impacts associated with strong seismic ground shaking would be less than significant.

iii) Seismic-related ground failure, including liquefaction?

Less-Than-Significant Impact. Liquefaction takes place when granular materials that are saturated by water lose strength and transform from a solid to a liquid. Liquefaction generally occurs during significant earthquake activity, and structures located on soils such as silt or sand may experience significant damage during an earthquake because of the instability of structural foundations and the moving earth.

According to the City's Public Safety Plan, the area located along Artesia Boulevard and the Dominguez Channel is located within a liquefaction zone identified in the Seismic Hazard Zones Map prepared by DOC (City of Gardena 2006d). As shown on DOC's regulatory map, the property to the east of the project

site is within a liquefaction zone; however, the existing Gardena Pumping Plant parcel and adjacent parcels to the west are not within a liquefaction zone (DOC 2019). Additionally, the project site is located in an area where geologic conditions are generally suitable to support a high density of land uses. The existing Gardena Pumping Plant contains dry/wet wells as deep as 40 feet, and the surrounding soils are able to support the existing development. Thus, it is anticipated that the geologic conditions adjacent to the existing pumping plant could also support the proposed project without risk of seismic ground failure, including liquefaction. Therefore, impacts associated with the liquefaction would be less than significant.

iv) Landslides?

No Impact. The project site and land within the surrounding area is relatively flat and lacks any hillsides or other natural topographic features typically susceptible to landslides. Additionally, according to DOC regulatory maps, the project site is not located in an area susceptible to earthquake-induced landslides (DOC 2019). Any excavation required for construction would be done in a manner that would prevent the creation of unstable slopes, and all disturbed areas would be returned to existing conditions upon completion of construction. Therefore, no impact associated with landslides would occur.

b) Would the project result in substantial soil erosion or the loss of topsoil?

Short-Term Construction Impacts

Less-Than-Significant Impact. The proposed project would include earthwork and other construction activities that would disturb surface soils and temporarily leave exposed soil on the ground's surface. To help curb erosion, proposed project construction activities must comply with all applicable federal, state, and local regulations for erosion control. The City, along with other municipalities in Los Angeles County, is required to control pollutant discharges in runoff from construction projects. Under the NPDES permit, the City is obligated to require compliance with runoff pollution mitigation approaches known as BMPs. Construction activities associated with the proposed project would comply with the requirements of Gardena Municipal Code Chapter 8.70, Stormwater and Runoff Pollution Control, which requires post-construction runoff pollution reduction BMPs through implementation of a standard urban stormwater mitigation plan. Typical BMPs include maintaining or creating drainages to convey and direct surface runoff from bare areas and installing physical barriers such as berms, silt fencing, and straw wattles. BMPs designed to reduce and capture soil erosion would reduce impacts associated with the proposed project to less than significant.

Long-Term Operational Impacts

Less-Than-Significant Impact. Following the completion of the construction of the proposed project, the project site would be fully developed and paved. The structural and paved improvements would generally be impervious areas lacking any exposed soils. Collectively, these surfaces would help to stabilize and retain soils on the project site while preventing erosion. Therefore, long-term operational impacts associated with soil erosion and topsoil loss would be less than significant.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

No Impact. The project site is located in an area where geologic conditions are generally suitable to support a high density of land uses, including the existing Gardena Pumping Plant and associated dry/wet wells. The existing Gardena Pumping Plant contains dry/wet wells as deep as 40 feet, and the surrounding soils are able to support the existing development. Thus, it is anticipated that the geologic conditions adjacent to the existing pumping plant could also support the proposed project. Additionally, the proposed project would adhere to the CBC to reduce any potential impacts associated with soil instability. If potentially unstable soils are encountered, modifications would be made based upon the requirements of the California Construction and General Industry Safety Orders, the Occupational Safety and Health Act, current amendments, and the Construction Safety Act. Therefore, there would be no impacts associated with unstable soil.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

No Impact. Expansive soils shrink and swell because of moisture change. These volume changes can result in damage to building foundations, underground utilities, and other subsurface facilities and infrastructure if they are not designed and constructed appropriately to resist changing soil conditions. Expansive soils are often associated with soils of high clay-materials content.

The project site is located in an area where geologic conditions are generally suitable to support a high density of land uses, including the existing Gardena Pumping Plant and associated dry/wet wells. The existing Gardena Pumping Plant contains dry/wet wells as deep as 40 feet, and the surrounding soils are able to support the existing development. Thus, it is anticipated the geologic conditions adjacent to the existing pumping plant could also support the proposed project. Therefore, there would be no impacts associated with expansive soils.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

No Impact. The project would not result in an increase in wastewater disposal or disposal in a septic tank or alternative wastewater disposal system. As a result, no impact would occur.

f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less-Than-Significant Impact With Mitigation Incorporated. A paleontological records search request was submitted to the Natural History Museum of Los Angeles County (LACM) on January 11, 2019, and the results were received on January 25, 2019. The results of this search indicated that the museum does not have any vertebrate fossil localities recorded within the project site boundaries or a 1-mile radius buffer; however, it has localities nearby from the same sedimentary deposits that occur subsurface. The closest LACM vertebrate fossil locality from older Quaternary sediments is LACM 4444, which is located just over a mile southwest of the project area within the Mobil Oil Refinery property that yielded a fossil

horse (*Equus*) and whale (Cetacea) at a depth of 15 feet below the ground surface (bgs) (McLeod 2019). The LACM also reported a mammoth (*Mammuthus*) specimen (LACM 2035) which was recovered northwest of the project site near the intersection of Prairie Avenue and 139th Street from an unknown depth. Two more mammoth (*Mammuthus*) specimens were reported by LACM: LACM 3382 was recovered from a depth of 5 feet bgs, east of the project near Wilmington Avenue and Artesia Boulevard, and LACM 1643 was recovered from a depth of 8 to 10 feet bgs along 190th Street near Annalee Avenue (McLeod 2019). Based on these localities and the potential for the discovery of new localities from within the project area, LACM recommended paleontological monitoring of excavations below the upper few feet in areas underlain by Quaternary alluvium and any excavations in areas underlain by older Quaternary deposits (elevated alluvium of Dibblee et al. [1999]).

No paleontological resources were identified within the project area as a result of the institutional records search and desktop geological review. Further, the project site is located within an area that has been previously developed and landscaped, so it is likely underlain by fill materials, at least in part. As such, and because the project area is underlain by older Quaternary alluvium below the fill, the project site is not anticipated to be underlain by unique geologic features. Although the project area has been disturbed by existing land use at the site, intact paleontological resources may be present below the original layer of fill material. Given past fossil discoveries in the surrounding area and the potential for intact, undisturbed Pleistocene-age deposits at a shallow depth, the project site is moderately to highly sensitive for supporting paleontological resources. In the event that intact paleontological resources are located on the project site, ground-disturbing activities associated with construction of the proposed project, such as grading during site preparation and excavations for underground utilities, have the potential to destroy a unique paleontological resource or site. Without mitigation, the potential damage to paleontological resources during construction would be a potentially significant impact. Therefore, mitigation measure MM-GEO-1 is recommended to reduce potential impacts to unanticipated archaeological resources to less-than-significant levels.

MM-GEO-1 Prior to the commencement of any grading activity, the applicant shall retain a qualified paleontologist, subject to the review and approval of the District to ensure the implementation of a paleontological monitoring program. The Society of Vertebrate Paleontology (SVP 2010) defines a qualified paleontologist as having:

1. A graduate degree in paleontology or geology, and/or a publication record in peer reviewed journals; and demonstrated competence in field techniques, preparation, identification, curation, and reporting in the state or geologic province in which the project occurs; an advanced degree is less important than demonstrated competence and regional experience;
2. At least 2 full years' professional experience as assistant to a project paleontologist with administration and project management experience; supported by a list of projects and referral contacts;
3. Proficiency in recognizing fossils in the field and determining significance;
4. Expertise in local geology, stratigraphy, and biostratigraphy; and
5. Experience collecting vertebrate fossils in the field.

The qualified paleontologist shall attend any preconstruction meetings and manage the paleontological monitor(s) if he or she is not doing the monitoring. A paleontological monitor should

be on site during all excavations below the depth of previously disturbed sediments. The Society of Vertebrate Paleontology (SVP 2010) defines a qualified paleontological monitor as having:

1. A Bachelor of Science or Bachelor of Arts degree in geology or paleontology and 1 year's experience monitoring in the state or geologic province of the specific project; an associate degree and/or demonstrated experience showing ability to recognize fossils in a biostratigraphic context and recover vertebrate fossils in the field may be substituted for a degree; an undergraduate degree in geology or paleontology is preferable but is less important than documented experience performing paleontological monitoring; or
2. An Associate of Science or Associate of Arts in geology, paleontology, or biology and a demonstrated 2 years' experience collecting and salvaging fossil materials in the state or geologic province of the specific project; or
3. Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and 2 years' monitoring experience in the state or geologic province of the specific project; and
4. Monitors must demonstrate proficiency in recognizing various types of fossils, in collection methods, and in other paleontological field techniques."

The paleontological monitor shall monitor construction excavations below a depth of 5 feet bgs in areas underlain by Quaternary alluvium and all excavations in areas underlain by elevated Quaternary alluvium as determined by the qualified paleontologist based on the construction plans. The paleontological monitor shall be equipped with necessary tools for the collection of fossils and associated geological and paleontological data. The monitor shall complete daily logs detailing the day's excavation activities and pertinent geological and paleontological data. In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor shall temporarily halt and/or divert grading activity to allow recovery of paleontological resources. The area of discovery shall be roped off with a 50-foot-radius buffer. Once documentation and collection of the find is completed, the monitor shall remove the rope and allow grading to recommence in the area of the find.

Following the paleontological monitoring program, a final monitoring report shall be submitted to the District for approval. The report shall summarize the monitoring program and include geological observations and any paleontological resources recovered during paleontological monitoring for the proposed project.

With the incorporation of mitigation, impacts associated with paleontological resources would be less than significant.

3.8 Greenhouse Gas Emissions

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less-Than-Significant Impact. Climate change refers to any significant change in measures of climate (e.g., temperature, precipitation, or wind patterns) lasting for an extended period of time (i.e., decades or longer). Earth's temperature depends on the balance between energy entering and leaving the planet's

system, and many factors (natural and human) can cause changes in Earth's energy balance. The greenhouse effect is the trapping and buildup of heat in the atmosphere near Earth's surface (the troposphere). The greenhouse effect is a natural process that contributes to regulating Earth's temperature, and it creates a livable environment on Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing Earth's surface temperature to rise. Global climate change is a cumulative impact; a project contributes to this impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. Thus, GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008).

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. As defined in California Health and Safety Code section 38505(g) for purposes of administering many of the state's primary GHG emissions reduction programs, GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and nitrogen trifluoride (see also CEQA Guidelines section 15364.5).[7] The three GHGs evaluated here are CO_2, CH_4, and N_2O because these gases would be emitted during proposed project's construction and operations.

The Intergovernmental Panel on Climate Change (IPCC) developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e). Consistent with CalEEMod version 2016.3.2, this GHG emissions analysis assumed the GWP for CH_4 is 25 (i.e., emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the IPCC's Fourth Assessment Report (IPCC 2007).

The City, in coordination with South Bay Cities Council of Governments (SBCCOG), prepared the *City of Gardena Climate Action Plan* (City CAP) to reduce GHG emissions within the City (City of Gardena and SBCCOG 2017). The City has established GHG reduction goals for year 2020 (15% below 2005 levels) and for year 2035 (49% below 2005 levels). The CAP includes a list of non-binding goals and strategies in the following five categories (City of Gardena and SBCCOG 2017):

- **Land Use and Transportation**: Facilitate pedestrian and neighborhood development and identify ways to reduce automobile emissions including supporting zero emission vehicle infrastructure, improving pedestrian and bicycle infrastructure, enhancing public transit service, and supporting reductions in single-occupancy vehicle use.
- **Energy Efficiency**: Emphasize energy efficiency retrofits for existing buildings, energy performance requirements for new construction, water efficient landscaping, financing programs that will allow home and business owners to obtain low-interest loans for implementing energy efficiency in their buildings.
- **Solid Waste**: Focus on increasing waste diversion and encouraging participation in recycling and composting throughout the community.

[7] Climate-forcing substances include GHGs and other substances such as black carbon and aerosols. This discussion focuses on the seven GHGs identified in California Health and Safety Code section 38505; impacts associated with other climate-forcing substances are not evaluated herein.

- **Urban Greening**: Create "carbon sinks" as they store GHG emissions that are otherwise emitted into the atmosphere as well as support health of the community.
- **Energy Generation and Storage**: Demonstrate the City's commitment to support the implementation of clean, renewable energy while decreasing dependence on traditional, GHG emitting power sources.

Notably, however, the City CAP is not a qualified CAP that can be used to tier from for CEQA purposes (City of Gardena and SBCCOG 2017):

> Within the CEQA process, a qualified CAP framework offers the ability to streamline future CEQA greenhouse gas analyses by being able to tier off the climate action plan. Depending on local factors, such as anticipated levels of development, a qualified CAP is not necessary and agencies would continue to utilize the framework for informing the selection and evaluation of climate planning strategies within the local context. The South Bay Cities Council of Governments CAP framework is unqualified, and offers cities a planning tool with optional strategies. The analysis and optional strategies in the CAP can be used in the future, by way of example, to help create a Qualified Climate Reduction Strategy under CEQA, to create GHG thresholds to be used in CEQA analysis and can be used to update the City's General Plan.

Thus, the City CAP cannot be used to tier from for this analysis. As such, this analysis uses the SCAQMD recommended (not adopted) numeric CEQA significance thresholds for GHG emissions for lead agencies to use in assessing GHG impacts of industrial development projects. In October 2008, the SCAQMD proposed recommended numeric CEQA significance thresholds for GHG emissions for lead agencies to use in assessing GHG impacts of residential and commercial development projects as presented in its Draft Guidance Document—Interim CEQA Greenhouse Gas (GHG) Significance Threshold (SCAQMD 2008b). This document, which builds on the previous guidance prepared by the California Air Pollution Control Officers Association, explored various approaches for establishing a significance threshold for GHG emissions. The draft interim CEQA thresholds guidance document was not adopted or approved by the Governing Board. However, in December 2008, SCAQMD adopted an interim 10,000 MT CO_2e per year screening level threshold for stationary source/industrial projects for which SCAQMD is the lead agency (SCAQMD 2008c). The 10,000 MT CO_2e per year threshold, which was derived from GHG reduction targets established in Executive Order S-3-05, was based on the conclusion that the threshold was consistent with achieving an emissions capture rate of 90% of all new or modified stationary source projects.

SCAQMD formed a GHG CEQA Significance Threshold Working Group to work with SCAQMD staff on developing GHG CEQA significance thresholds until statewide significance thresholds or guidelines are established. From December 2008 to September 2010, SCAQMD hosted working group meetings and revised the draft threshold proposal several times, although it did not officially provide these proposals in a subsequent document. SCAQMD has continued to consider adoption of significance thresholds for residential and general land-use development projects. The most-recent proposal issued by SCAQMD (in September 2010) uses the following tiered approach to evaluate potential GHG impacts from various uses (SCAQMD 2010):

Tier 1. Determine if CEQA categorical exemptions are applicable. If not, move to Tier 2.

Tier 2. Consider whether the proposed project is consistent with a locally adopted GHG reduction plan that has gone through public hearing and CEQA review, that has an approved inventory, includes monitoring, etc. If not, move to Tier 3.

Tier 3. Consider whether the project generates GHG emissions in excess of screening thresholds for individual land uses. The 10,000 MT CO_2e per year threshold for industrial uses would be recommended for use by all lead agencies. Under option 1, separate screening thresholds are proposed for residential projects (3,500 MT CO_2e per year), commercial projects (1,400 MT CO_2e per year), and mixed-use projects (3,000 MT CO_2e per year). Under option 2, a single numerical screening threshold of 3,000 MT CO_2e per year would be used for all non-industrial projects. If the proposed project generates emissions in excess of the applicable screening threshold, move to Tier 4.

Tier 4. Consider whether the proposed project generates GHG emissions in excess of applicable performance standards for the project service population (population plus employment). The efficiency targets were established based on the goal of Assembly Bill (AB) 32 to reduce statewide GHG emissions to 1990 levels by 2020. The 2020 efficiency targets are 4.8 MT CO_2e per service population for project-level analyses and 6.6 MT CO_2e per service population for plan-level analyses. If the project generates emissions in excess of the applicable efficiency targets, move to Tier 5.

Tier 5. Consider the implementation of CEQA mitigation (including the purchase of GHG offsets) to reduce the project efficiency target to Tier 4 levels.

To determine the proposed project's potential to generate GHG emissions that would have a significant impact on the environment, its GHG emissions were compared to the SCAQMD-recommended industrial project quantitative threshold of 10,000 MT CO_2e per year.

Construction GHG Emissions

Construction of the proposed project would result in GHG emissions that are primarily associated with the use of off-road construction equipment, on-road haul and vendor trucks, and worker vehicles. SCAQMD recommends that "construction emissions be amortized over a 30-year project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies" (SCAQMD 2008b). Thus, the total construction GHG emissions were calculated, amortized over 30 years, and added to the total operational emissions for comparison with the GHG significance threshold of 10,000 MT CO_2e per year. The determination of significance, therefore, is addressed in the operational emissions discussion following this estimated construction GHG emissions discussion.

CalEEMod was used to calculate the annual GHG emissions based on the construction scenario described in Section 3.3. Construction of the proposed project is anticipated to commence in July 2021 and would last approximately 30 months. On-site sources of GHG emissions include off-road equipment; off-site sources include haul trucks, vendor trucks, and worker vehicles. Table 7, Estimated Annual Construction GHG Emissions, presents construction GHG emissions for the proposed project from on-site and off-site emission sources.

Table 7. Estimated Annual Construction GHG Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
2021	77.21	0.01	0.00	77.54
2022	210.83	0.04	0.00	211.91
2023	137.70	0.04	0.00	138.68
			Total	**428.13**
			Amortized Emissions (over 30 years)	**14.27**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix A for complete results.

As shown in Table 7, the estimated total GHG emissions during construction of the proposed project would be approximately 428 MT CO_2e. Estimated project-generated construction emissions amortized over 30 years would be approximately 14 MT CO_2e per year. As with project-generated construction air quality pollutant emissions, GHG emissions generated during the construction of the proposed project would be short-term in nature, lasting only the duration of the construction period, and would not represent a long-term source of GHG emissions. Because there is no separate GHG threshold for construction, the evaluation of significance is discussed in the operational emissions analysis in the following text.

Operational GHG Emissions

CalEEMod version 2016.3.2 was used to estimate potential project-generated operational GHG emissions from vehicular sources, area sources (i.e., landscape maintenance), electrical generation, and stationary sources (i.e., emergency-generator testing). Based on input from the Districts, the proposed project would not involve natural gas combustion, water consumption, or solid waste generation. Emissions from each category are discussed in the following text with respect to the proposed project. Operational year 2024 was assumed to be the first full year of operation following completion of construction.

Area Sources

CalEEMod was used to estimate GHG emissions from the project's area sources, which include the operation of gasoline-powered landscape maintenance equipment, which produces minimal GHG emissions. It was assumed that 100% of the landscaping equipment would be gasoline-powered. Consumer product use and architectural coatings result in VOC emissions, which are analyzed in the air quality analysis only.

Energy Sources

The estimation of operational energy emissions was based on the Districts-provided annual electricity estimate of 361,747 kilowatt-hours. It is anticipated that the proposed project would result in the same electricity consumption as the existing pumping plant. Annual electricity emissions were estimated in CalEEMod using the emissions factors for SCE, which would be the energy source provider for the proposed project. In addition, for electricity, the CO_2 intensities for both the existing scenario and proposed project were adjusted based on the value reported the SCE 2017 Power Content Label, including 32% renewables (CEC 2018).

Mobile Sources

All details for criteria air pollutants discussed in Section 3.3 are also applicable for the estimation of operational mobile source GHG emissions. Regulatory measures related to mobile sources include AB 1493 (Pavley) and related federal standards. AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other vehicles determined by CARB to be vehicles that are primarily used for noncommercial personal transportation in the state. In addition, the National Highway Traffic Safety Administration and U.S. Environmental Protection Agency have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the proposed project's motor vehicles. The effectiveness of fuel economy improvements was evaluated to the extent it was captured in the EMFAC2014 emission factors for motor vehicles in 2019 and 2024 for the existing scenario and the proposed project, respectively.

Stationary Sources

Testing of the 150 kW emergency generator at the existing pumping plant and the proposed 350 kW emergency generator was modeled using CalEEMod, assuming an annual maximum testing duration of 50 hours. The default emission rates for the existing emergency generator were adjusted based on the age of the equipment (model year 1988) and represent a Tier 1 engine. For the proposed generator, CalEEMod default emission rates were used, which represent a Tier 3 engine.

Table 8, Estimated Annual Operational GHG Emissions, presents the annual GHG emissions associated with operation of the existing pumping plant and the proposed project. Additional details are included in Appendix A.

Table 8. Estimated Annual Operational GHG Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Existing Pumping Plant				
Area	<0.01	0.00	0.00	<0.01
Energy	98.71	0.01	<0.01	99.12
Mobile	5.43	<0.01	0.00	5.44
Emergency Generator Testing	3.83	<0.01	0.00	3.84
			Existing Pumping Plant Total	**108.40**
Proposed Project				
Area	<0.01	0.00	0.00	<0.01
Energy	98.71	0.01	<0.01	99.12
Mobile	4.73	<0.01	0.00	4.73
Emergency Generator Testing	8.93	<0.01	0.00	8.96
			Proposed Project Total	**112.82**
			Operational Incremental Increase (Project minus Existing)	**4.42**
			Amortized Construction Emissions	*14.27*
			Operation + Amortized Construction Total	**18.69**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent
See Appendix A for detailed results.
Values of "<0.01" indicate that the estimated emissions are less than two decimals. Totals may not sum due to rounding.

As shown in Table 8, the estimated net increase in annual project-generated GHG emissions would be approximately 4 MT CO_2e per year as a result of project operation. When summed with the amortized project construction emissions, the total annual net increase would be approximately 19 MT CO_2e per year. Annual operational GHG emissions with amortized construction emissions would be minimal and would not exceed the SCAQMD threshold of 10,000 MT CO_2e per year. Therefore, the proposed project's GHG contribution would not be cumulatively considerable and is less than significant.

b) Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less-Than-Significant Impact. The City, in coordination with SBCCOG, has developed a CAP to reduce GHG emissions within the City and thereby reduce the City's contribution to global climate change concerns. However, this CAP is not a Qualified GHG Emissions Reduction Plan under CEQA per the requirements outlined in CEQA Guidelines section 15183.5(D); therefore, no CEQA document can tier from the City CAP. Although there are no mandatory GHG plans, policies, or regulations or finalized agency guidelines that would apply to implementation of the proposed project, a description of the relevant plans with GHG reduction strategies is provided below.

The City CAP includes GHG reduction strategies in the sectors of land use and transportation, energy efficiency, solid waste, urban greening, and energy generation and storage to reach the City's GHG reduction targets (City of Gardena and SBCCOG 2017). The proposed project would address the existing safety, reliability, and maintenance issues of the existing Gardena Pumping Plant and would not conflict with any of the GHG reduction measures provided within the City's CAP.

California's 2017 Climate Change Scoping Plan, approved by CARB in 2008 and updated in 2014 and 2017, provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. The scoping plan is not directly applicable to specific projects, and it is not intended to be used for project-level evaluations.[8] Under the scoping plan, however, there are several state regulatory measures aimed at identifying and reducing GHG emissions. CARB and other state agencies have adopted many of the measures identified in the scoping plan. Most of these measures focus on area-source emissions (e.g., energy usage and high-GWP GHGs in consumer products) and changes to the vehicle fleet (e.g., hybrid, electric, and more-fuel-efficient vehicles) and associated fuels, among others.

SCAG's 2016 RTP/SCS is a regional growth-management strategy that targets per-capita GHG reduction from passenger vehicles and light-duty trucks in the Southern California region. The 2016 RTP/SCS incorporates local land use projections and circulation networks in city and county general plans. The 2016 RTP/SCS is not directly applicable to the proposed project because the purpose of the 2016 RTP/SCS is to provide direction and guidance by making the best transportation and land use choices for future development. However, the replacement of the existing Gardena Pumping Plant under the proposed project would not conflict with implementation of the strategies identified in the 2016 RTP/SCS that would reduce GHG emissions.

8 The Final Statement of Reasons for the amendments to the CEQA Guidelines reiterates the statement in the Initial Statement of Reasons that "[t]he Scoping Plan may not be appropriate for use in determining the significance of individual projects because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping Plan" (California Natural Resources Agency 2009).

Regarding consistency with Senate Bill (SB) 32 (goal of reducing GHG emissions to 40% below 1990 levels by 2030) and Executive Order S-3-05 (goal of reducing GHG emissions to 80% below 1990 levels by 2050), there are no established protocols or thresholds of significance for that future-year analysis. However, CARB has expressed optimism with regard to both the 2030 and 2050 goals. It states in the First Update to the Climate Change Scoping Plan: Building on the Framework that "California is on track to meet the near-term 2020 GHG emissions limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (CARB 2014). Regarding the 2050 target for reducing GHG emissions to 80% below 1990 levels, CARB (2014) states the following:

> This level of reduction is achievable in California. In fact, if California realizes the expected benefits of existing policy goals (such as 12,000 megawatts of renewable distributed generation by 2020, net zero energy homes after 2020, existing building retrofits under Assembly Bill 758, and others) it could reduce emissions by 2030 to levels squarely in line with those needed in the developed world and to stay on track to reduce emissions to 80% below 1990 levels by 2050. Additional measures, including locally driven measures and those necessary to meet federal air quality standards in 2032, could lead to even greater emission reductions.

In other words, CARB believes that the state is on a trajectory to meet the 2030 and 2050 GHG reduction targets set forth in AB 32, SB 32, and Executive Order S-3-05. This is confirmed in the 2017 Climate Change Scoping Plan Update, which states (CARB 2017b):

> The Proposed Plan builds upon the successful framework established by the Initial Scoping Plan and First Update, while also identifying new, technologically feasibility and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The Proposed Plan is developed to be consistent with requirements set forth in AB 32, SB [Senate Bill] 32, and AB 197.

The proposed project would not interfere with implementation of GHG reduction goals for 2030 or 2050 because it would not exceed SCAQMD's recommended threshold of 10,000 MT CO_2e per year. In addition, the proposed project would not conflict with the state's trajectory toward future GHG reductions. Therefore, the proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs; therefore, the impact would be less than significant.

3.9 Hazards and Hazardous Materials

The following analysis is based on the Preliminary Environmental Evaluation prepared by Dudek in April 2019, and included as Appendix C. The evaluation included a search of regulatory records conducted by EDR on March 6, 2019, a search of online regulatory databases, review of historical aerial photographs, and review of City Directory listings.

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Short-Term Construction

Less-Than-Significant Impact With Mitigation Incorporated. The potential impacts associated with the routine transport, use, or disposal of hazardous materials resulting from the proposed project are described below.

Use of Hazardous Materials

A variety of hazardous materials, including fuels for equipment and vehicles, new and used motor oils, cleaning solvents, and paints, would be transported to and stored, used, and generated on the project site during construction activities for the proposed project. Improper handling and/or use of these materials during construction would represent a potential risk to the public and the environment. Construction contractors are responsible for accident prevention and containment, and construction specifications typically include provisions to properly manage hazardous substances and wastes. All contractors are required to comply with applicable regulations and California Occupational Safety and Health Administration (OSHA) guidelines regarding the transport, use, and disposal of hazardous materials and hazardous waste. Examples of hazardous materials management include providing completely enclosed containment for all refuse generated in the planning area. In addition, all construction waste, including trash, litter, garbage, solid waste, petroleum products, and any other potentially hazardous materials, would be removed and transported to a permitted waste facility for treatment, storage, and/or disposal. Compliance with applicable regulations and OSHA guidelines would ensure that proper use and disposal of these materials would not pose a significant risk to the public and the environment.

Subsurface Impacts

A search of regulatory records was conducted by EDR on March 6, 2019. The search was conducted for the project site, and includes a 0.25-mile, a 0.5-mile, and a 1-mile search radius. As part of the Preliminary Environmental Evaluation (Appendix C), Dudek reviewed the listings, the distance from the project site, and known environmental conditions (e.g., groundwater depth and flow direction), and determined the following sites to be potential environmental concerns to the proposed project:

- Sears Roebuck and Company (1917 Artesia Boulevard): The adjacent site to the east was the former location of a gasoline underground storage tank (UST). Following UST removal in 1987, residual soil and groundwater impacts were identified beneath the former UST. Although the release case received agency closure, it did so with 35 µg/L benzene detected in the groundwater. The location of the former UST is not known because of the poor figures in the UST case reports; it may be immediately adjacent to the project site. Therefore, it is possible that gasoline-impacted soil and/or groundwater is present under the project site.
- Thiem Industries (1918 Artesia Boulevard) and Freeman Products (2040 Artesia Boulevard): The former Freeman Products (Freeman) and Thiem Industries (Thiem) sites, are located south and southwest of the project site, respectively (Figure 7, Potential Environmental Concerns). Historical operations at Freeman and Thiem have contributed to chlorinated volatile organic compounds (CVOC) contamination in groundwater, which is currently under remediation, but still above regulatory screening levels. Recent groundwater data indicate that the CVOC contamination is present beneath the Freeman and Thiem sites, as well as the two sites in

between. Figure 7 includes the locations of the nearest groundwater monitoring wells for the Freeman and Thiem sites and the reported CVOC contamination above the applicable screening levels (California maximum contaminant levels for drinking water are 5 µg/L for TCE and PCE, 6 µg/L for 1,1-DCE; the California Department of Health Services notification level is 1 µg/L for 1,4-dioxane). Groundwater has been reported at depths of approximately 22 to 28.5 feet bgs. Although data suggest that contaminated groundwater has not migrated north into Artesia Boulevard or the project site, construction of the proposed project would require excavation up to 40 feet bgs. This excavation would encounter groundwater and, therefore, require dewatering, which could potentially cause drawdown and subsequent migration of the contaminated groundwater onto the project site.

Additionally, based on the findings of the City directories, the proposed project site and surrounding areas have been used for dry cleaning and manufacturing purposes since at least 1970. These types of industries generally use, store, and dispose of hazardous materials and petroleum products as part of daily business activities. Dry cleaners in the 1970s would have used chlorinated solvents. Based on the potential former use of chlorinated solvents on the project site and other potential chemical use, there is a potential for undocumented environmental contamination to be present, which may impact the project site.

To reduce any impacts from potentially contaminated subsurface conditions, a hazardous materials management/contingency plan (HMMCP) should be prepared prior to the commencement of construction activities (mitigation measure MM-HAZ-1).

MM-HAZ-1 Hazardous Materials Management/Contingency Plan. Prior to construction, the District shall develop a hazardous materials management/contingency plan (HMMCP) that addresses the potential concern related to the anticipated locations of contaminated soils and groundwater, and anticipated contaminants. The HMMCP shall be followed during demolition, excavation, and construction activities for the proposed project. The HMMCP shall include training procedures for identification of contaminated soils and groundwater (if anticipated to be encountered) in the excavations. Contaminated soils and/or groundwater shall be managed and disposed of in accordance with local and state regulations. The HMMCP shall include health and safety measures including periodic work breathing zone monitoring and potential South Coast Air Quality Management District Rule 1166 monitoring for volatile organic compounds using a handheld organic vapor analyzer, in the event impacted soils are encountered during excavation activities. The District or its construction contractor shall implement the HMMCP during construction activities for the proposed project. If impacts are encountered in the excavation, the HMMCP shall contain procedures for evaluation of the impacts and notification, as necessary.

Implementation of mitigation measure MM-HAZ-1 would reduce potential impacts associated with contaminated soils, groundwater, and/or other environmental contaminants to less-than-significant levels.

Potential Environmental Concerns

Gardena Pumping Plant Upgrades

INTENTIONALLY LEFT BLANK

Lead-Based Paint and Asbestos

Based on the age of the structures (pre-1980s) on the proposed project site, there is a potential for asbestos, lead-based paint, and other hazardous building materials, such as polychlorinated biphenyls and mercury, to be present in the building's materials. Construction of the proposed project would require demolition of the existing structures on the project site. If asbestos is detected during demolition or construction activities, standard regulatory practices would be applied (development of a health and safety plan, protective equipment, fugitive dust controls, best management practices, etc.). Additionally, existing state regulations require the abatement and control of asbestos and lead in advance of demolishment or renovation activities, pursuant to SCAQMD Rule 1403 (asbestos) and California Code of Regulations Title 8. If not properly abated, the accidental release of asbestos and/or lead could pose a hazard to the environment and public health. This is considered a potentially significant impact prior to mitigation. Therefore, implementation of mitigation measure MM-HAZ-2 is required. MM-HAZ-2 will require that, prior to construction or demolition activities, a lead-based paint and asbestos survey be completed by a California OSHA-certified asbestos assessor and a California Department of Public Health–certified lead-based-paint assessor. Depending on the findings of the survey, it may be necessary to prepare an abatement work plan that complies with all federal, state, and local laws and describes monitoring and abatement activities that must be performed as part of construction activities to prevent exposure to asbestos and lead-based paint.

MM-HAZ-2 Prior to the demolition of on-site buildings, a lead-based paint and asbestos survey shall be conducted by a California Occupational Safety and Health Administration–certified asbestos consultant and/or certified site surveillance technician and a California Department of Public Health–certified lead inspector/risk assessor or sampling technician. These persons shall provide the Districts with a report documenting material types, conditions, and general quantities along with diagrams and photos of positive materials. Demolition or renovation plans and contract specifications must incorporate any abatement procedures for the removal of material containing asbestos or lead-based paint. All abatement work must be performed in accordance with all applicable federal, state, and local regulations.

Implementation of mitigation measure MM-HAZ-2 would prevent exposure to asbestos and lead-based paint during construction activities. Impacts would be less than significant after mitigation.

Long-Term Operations

No Impact. The proposed project involves the construction of a consolidated pumping plant to address the existing maintenance issues associated with the existing pumping plant, which currently operates as two functionally separate pumping plants. Once operational, the proposed project would not differ from the existing uses or the current operations at the project site. Further, because of the update in equipment and consolidation of the pumping plant activities, there would be fewer safety, reliability, and maintenance issues. As such, there would be fewer operational activities associated routine transport, use, or disposal of hazardous materials. Therefore, no impacts would occur.

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less-Than-Significant Impact With Mitigation Incorporated. As discussed in Section 3.9(a), because of the former uses located adjacent to and surrounding the project site, there is the possibility that impacted

groundwater from the Freeman and Thiem sites, and gasoline-impacted soil and/or groundwater from the former gasoline UST to the east could result in the release of hazardous materials into the environment. Preparation of an HCCMP would be required to manage impacts from accidental spills or contaminated soils if discovered during construction (mitigation measure MM-HAZ-1).

Based on the age of the structures (pre-1980s) on the project site, there is a potential for asbestos, lead-based paint, and other hazardous building materials, such as polychlorinated biphenyls and mercury, to be present in the building's materials. Therefore, mitigation measure MM-HAZ-2 is recommended, which will require that, prior to construction or renovation activities, a lead-based paint and asbestos survey be completed by a California OSHA-certified asbestos assessor and a California Department of Public Health–certified lead-based paint assessor.

Upon implementation of mitigation measures MM-HAZ-1 and MM-HAZ-2, impacts associated with the release of hazardous materials into the environmental would be less than significant.

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less-Than-Significant Impact. The nearest school to the project site is Casimir Middle School (17220 Casimir Avenue), located approximately 0.3 miles west of the project site. Additionally, operation of the proposed project would not involve storage or use of chemicals. As such, the proposed project would not emit hazardous air emissions within 0.25 miles of a school. Therefore, the proposed project would have less-than-significant impacts on existing or proposed schools.

d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less-Than-Significant Impact With Mitigation Incorporated. Pursuant to CEQA, the California Department of Toxic Substances Control maintains a Hazardous Waste and Substances Sites List (Cortese List). Government Code section 65962.5(a) requires that the list be updated at least annually to reflect new information regarding previously listed sites or new sites requiring response action (CalEPA 2019).

According to the Preliminary Environmental Evaluation (Appendix C), multiple sites were identified on Cortese List databases within a 0.25-mile radius of the project site; however, the project site was not listed. The project site is adjacent to 1917 Artesia Blvd address, which was listed in the State Water Resources Control Board's LUST database; however, that release case has been closed.

Nonetheless, because of the potential for encountering impacted groundwater and/or soils associated with the adjacent former UST site and the Freeman and Thiem sites during project construction, mitigation measure MM-HAZ-1 would be implemented to ensure that hazardous materials sites do not create a significant hazard to the public or the environment. Implementation of mitigation measure MM-HAZ-1 would reduce impacts to less-than-significant levels.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No Impact. The nearest airport to the project site is Hawthorne Municipal Airport, located approximately 3.6 miles northeast of the project site in the City of Hawthorne. As such, the proposed project would not be located within 2 miles of a public airport. In addition, the project site is not within the Airport Influence Area for Hawthorne Municipal Airport, and as such, the proposed project would not result in a safety hazard for people working in the project area (County of Los Angeles 2019). Therefore, no impacts associated with airport safety hazards would occur.

f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less-Than-Significant Impact With Mitigation Incorporated. The City's Emergency Operations Plan (EOP) addresses the planned response to extraordinary emergency situations associated with natural disasters, technological incidents, and national security emergencies. The City's EOP establishes the emergency organization, assigns tasks, and specifies policies and general procedures. The EOP is designed to include Gardena in the overall California State Standardized Emergency Management System, which provides a framework for coordinating multi-agency responses in the case of emergencies (City of Gardena 2006d). Because the proposed project would result in operations similar to the existing condition, the proposed project would not conflict with the provisions of the City's EOP.

As discussed in Section 2.4, Project Construction, construction of the proposed project would require temporary lane closures at Artesia Boulevard, which could temporarily interfere with emergency evacuation. However, incorporation of a construction traffic management plan, as required by mitigation measure MM-TRAF-1 (see Section 3.17(c)), and associated traffic control plans, as well as adherence to the Standard Specifications for Public Works Construction (Greenbook) and *Work Area Traffic Control Handbook* (WATCH) *Manual*, would ensure that any temporary impacts on emergency vehicle flow and/or ingress/egress to properties along Artesia Boulevard are coordinated in advance with emergency service providers and law enforcement to ensure that sufficient emergency service, access, and evacuation will be provided during construction if necessary. In addition, the District would obtain an encroachment permit from the cities of Gardena and Torrance to ensure coordination with emergency service providers and law enforcement. The implementation of mitigation measure MM-TRAF-1 would reduce impacts related to emergency access to less-than-significant levels.

g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?

No Impact. Much of the land surrounding the project site is highly developed, and as a whole, the project area lacks any lands considered wildlands or wildland–urban interfaces. According to the California Department of Forestry and Fire Protection's Fire Hazard Severity Zones maps, the project site is neither moderately, highly, nor very highly susceptible to wildland fire (CAL FIRE 2019). Therefore, no impacts associated with wildland fires would occur.

3.10 Hydrology and Water Quality

a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Short-Term Construction

Less-Than-Significant Impact. Construction associated with the proposed project involves earthwork activities that would disturb soil. Soil erosion could result from these activities, thereby potentially affecting the water quality of local downstream waterways. As previously addressed in Section 3.7, Geology and Soils, the City, along with other municipalities in Los Angeles County, is required to control pollutant discharges in runoff from construction projects. Under the NPDES permit, the City is obligated to require compliance with runoff pollution mitigation approaches known as BMPs. Construction activities associated with the proposed project would comply with requirements of Gardena Municipal Code chapter 8.70, Stormwater and Runoff Pollution Control, which requires post-construction runoff pollution reduction BMPs through implementation of a standard urban stormwater mitigation plan. Sediment-control BMPs may include stabilized construction entrances, sediment filters on existing inlets, or the equivalent to reduce erosion impacts and to prevent, to the extent feasible, stormwater runoff conveying sediments to downstream receiving waters. Therefore, short-term construction impacts associated with the proposed project would be less than significant.

Long-Term Operations

Less-Than-Significant Impact. Upon the completion of construction, the project site would be restored to its preconstruction conditions and no loss of topsoil affecting downstream waterways would occur. The proposed project would continue to serve as a pump station to convey sewage flow once operational. In addition, the proposed project is located within a developed, impervious landscape and is not a site of groundwater infiltration; thus, impacts to groundwater quality would be less than significant. Therefore, operational impacts associated with water quality standards would be less than significant.

b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

No Impact. The proposed project would not require the permanent use of water supplies, which could decrease groundwater supplies. In addition, the proposed project is located within a developed, impervious landscape and is not a site of groundwater infiltration. Therefore, the construction and operations associated with the proposed project would not decrease groundwater or interfere substantially with groundwater recharge that may impede sustainable groundwater management. As such, no impact would occur.

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) result in substantial erosion or siltation on or off site;

Less-Than-Significant Impact. Under the existing condition, the project site and surrounding area is entirely developed and impervious. The proposed project involves the construction of a consolidated pumping plant within an entirely impervious area. As such, the proposed project would not substantially alter the existing drainage pattern of the site or area. Additionally, the proposed project would not alter the existing course of the Dominguez Channel, located approximately 160 feet to the east of the project site. Nonetheless, the proposed project would be required to implement post-construction runoff pollution reduction BMPs to ensure that on-site drainage would not result in substantial erosion or siltation on or off site. Therefore, impacts associated with altering the existing drainage pattern of the project site would be less than significant.

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;

Less-Than-Significant Impact. As discussed previously in Section 3.10(c)(i), the proposed project would not involve any additional pervious areas, would not alter an existing water course, and would not alter the existing drainage pattern on or off site. Therefore, impacts would be less than significant.

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

Less-Than-Significant Impact. The proposed project would upgrade the existing Gardena Pumping Plant. Construction would include earthwork activities that could potentially result in stormwater runoff; however, the proposed project would be required to comply with BMPs to reduce and capture soil erosion. Upgrades associated with the proposed project would not change the amount of impervious surfaces that would permit increased stormwater.

iv) impede or redirect flood flows?

No Impact. According to Federal Emergency Management Agency Flood Insurance Rate Map Panel No. 06037C1936F, the project site is not located within a 100-year flood zone (FEMA 2008). Although the Dominguez Channel is located approximately 160 feet to the east of the project site, the proposed project would not impede or redirect flood flow. Therefore, no impact would occur.

d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

Less-Than-Significant Impact. Seiches are large waves generated in enclosed bodies of water in response to ground shaking. There are no reservoirs or other enclosed water bodies nearby that would create a seiche hazard. Tsunamis are large waves generated in large bodies of water by fault displacement or major ground movement. Based on the inland location of the proposed pumping plant, tsunamis do not pose a hazard to the proposed project. Additionally, the proposed project would implement BMPs to

ensure flows from the project site would not release pollutants into downstream receiving waters. Therefore, impacts associated with risk of release of pollutants caused by project inundation in a flood hazard, tsunami, or seiche zone would be less than significant.

e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less-Than-Significant Impact. The proposed project would comply with regional and local regulations requiring preparation of a water quality control plan, and would not obstruct existing plans. In addition, the proposed project is not considered a suitable site for groundwater recharge and would not introduce impervious areas over a significant groundwater recharge zone. Therefore, impacts associated with conflict with a water quality control plan or sustainable groundwater management plan would be less than significant.

3.11 Land Use and Planning

a) Would the project physically divide an established community?

No Impact. The physical division of an established community typically refers to the construction of a linear feature (such as a major highway or railroad tracks) or removal of access (such as a local road or bridge) that would impair mobility within an existing community and outlying area. The project site and surrounding area contain predominately commercial land uses. The project site is not used as a connection between established communities. Instead, connectivity within the area surrounding the project site is facilitated via local roadways. Therefore, no impact would occur.

b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

No Impact. The Gardena Pumping Plant is operated by the Districts, and the parcels on which the proposed project construction would occur would be owned and operated by the Districts. The proposed project and the Districts would comply with applicable development standards contained in the City's municipal code. Because the proposed project involves upgrades to the existing pumping plant, the proposed use is consistent with the general plan's Industrial designation, and the General Commercial zone (Z-3). As such, the proposed project would be in compliance with applicable local plans governing the project site.

Regional plans applicable to the proposed project that have been adopted for the purpose of reducing environmental impacts associated with projects in the Southern California region include the 2016 AQMP and the Congestion Management Plan (CMP) for Los Angeles County. As discussed in Section 3.3(a), the proposed project would not conflict with or obstruct implementation of the applicable AQMP. The purpose of the CMP is to link local land use decisions with their impacts on regional transportation and air quality and to develop a partnership among transportation decision makers to devise appropriate transportation solutions that include all modes of travel. The CMP transportation impact analysis process requires an analysis of projects that could add 50 or more trips to a CMP arterial intersection or more than 150 trips to a CMP mainline freeway location in either direction during the AM or PM weekday peak hours. The proposed project would not result in any additional trips compared to the existing condition and, thus, would not exceed the threshold of 50 trips. As such, no conflict with the CMP would occur.

In summary, the proposed project would not conflict with any applicable land use plan, policy, or regulation. Because no conflict with a policy or regulation would occur, the proposed project would not result in a significant environmental impact resulting from a conflict with a land use plan. Therefore, there would be no impacts.

3.12 Mineral Resources

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact. DOC, Division of Mines and Geology, mapped mineral resource zones within Los Angeles County. According to DOC's Mineral Lands Classification Map, the project site is not located within an area with known mineral resources. The project site is designated as MRZ-1, an area where adequate information indicates that no significant mineral deposits are present, or where it is judged that little likelihood exists for their presence (DOC 1982). Therefore, no impact associated with loss of availability of a known mineral resource would occur.

b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

No Impact. The general plan's Land Use Plan does not identify mineral resources within the City, nor does it identify any land uses for mineral resource recovery sites (City of Gardena 2006e). Therefore, no impact associated with loss of availability of a locally important mineral resource recovery site would occur.

3.13 Noise

Existing Setting

Generally, federal and state agencies regulate mobile noise sources by establishing and enforcing noise standards on vehicle manufacturers. Local agencies generally regulate stationary noise sources and construction activities to protect neighboring land uses and the public's health and welfare. Noise-sensitive land uses include residences, hotels and motels, schools and universities, hospitals, and churches. The nearest noise-sensitive land uses to the project site are residences located to the west and a church located to the southwest.

A brief background on the fundamentals of environmental acoustics is helpful in understanding how humans perceive various sound levels. Although extremely loud noises can cause temporary or permanent damage, the primary environmental impact of noise is annoyance. The objectionable characteristic of noise often refers to its loudness. Loudness represents the intensity of the sound wave, or the amplitude of the sound wave height measured in decibels (dB). Decibels are calculated on a logarithmic scale; thus, a 10 dB increase represents a tenfold increase in acoustic energy or intensity, and a 20 dB increase represents a hundredfold increase in intensity. Decibels are the preferred measurement of environmental sound because of the direct relationship between a sound's intensity and the subjective "noisiness" of it. The A-weighted decibel (dBA) system is a convenient sound measurement technique that weights selected frequencies based on how well humans can perceive them.

The range of human hearing spans from a minimal threshold of hearing (approximately 0 dBA) to a level of noise that is past the threshold of pain (approximately 120 dBA). In general, human sound perception is such that a change in sound level of 3 dBA in a normal setting (i.e., outdoors or in a structure, but not in an acoustics laboratory without background noise levels) is just noticeable, and a change of 5 dBA is clearly noticeable. A change of 10 dBA is perceived as a doubling (or halving) of sound level. Noise levels are generally considered low when they are below 45 dBA, moderate in the 45 to 60 dBA range, and high above 60 dBA. Noise levels greater than 85 dBA can cause temporary or permanent hearing loss with sustained exposure.

Ambient environmental noise levels can be characterized by several different descriptors. Energy equivalent or energy average noise level (L_{eq}) describes the average or mean noise level over a specified period of time. L_{eq} provides a useful measure of the impact of fluctuating noise levels on sensitive receptors over a period of time. Other descriptors of noise incorporate a weighting system that accounts for human's susceptibility to noise irritations at night. Community Noise Equivalent Level (CNEL) is a measure of cumulative noise exposure over a 24-hour period, with a 5 dBA penalty added to evening hours (7 p.m. to 10 p.m.) and a 10 dBA penalty added to nighttime hours (10 p.m. to 7 a.m.). Because CNEL is a 24-hour-average noise level, an area could have sporadic loud noise levels that are above 65 dBA but that average lower over the 24-hour period.

Existing Noise Conditions

Currently, the proposed project site generates noise associated with the existing east and west pumping plants. Additionally, the project site and surrounding area is subject to traffic noise associated with nearby roadways, including West Artesia Boulevard.

Noise measurements were conducted on and near the project site in March 2019 to characterize the existing noise environment. The daytime, short-term (1 hour or less) staff-attended sound-level measurements were taken with a SoftdB Piccolo sound-level meter. This sound-level meter meets the current American National Standards Institute standard for a Type 2 (general purpose) sound-level meter. The calibration of the sound-level meter was verified before and after the measurements were taken, and the measurements were conducted with the microphone positioned approximately 5 feet above the ground.

The Districts selected three noise measurement locations (ST1–ST3) on, adjacent to, or near the project site that represent key potential sensitive receptors or sensitive land uses. The measurement locations are shown in Figure 8, Noise Measurement Locations, and the measured average noise levels and measurement locations are provided in Table 9, Measured Noise Levels. Noise measurement data are also included in Appendix D, Noise. The primary noise source at the measurement locations consisted of traffic along West Artesia Boulevard. As shown in Table 9, the existing daytime ambient noise levels ranged from approximately 71 dBA at ST1 to 74 dBA at ST2.

Table 9. Measured Noise Levels

Receptors	Location/Address	Date	Time	L_{eq} (dBA)	L_{max} (dBA)
ST1	19195 W. Artesia Boulevard; adjacent to existing pumping plant	March 28, 2019	9:40 a.m.–9:56 a.m.	70.9	79.9
ST2	2003 W. Artesia Boulevard; adjacent to residences at West Artesia Boulevard and Gramercy Place	March 28, 2019	9:59 a.m.–10:15 a.m.	73.6	82.8

Table 9. Measured Noise Levels

Receptors	Location/Address	Date	Time	L_{eq} (dBA)	L_{max} (dBA)
ST3	2000 W. Artesia Boulevard; adjacent to church	March 28, 2019	10:19 a.m.–10:34 a.m.	73.4	80.9

Source: Appendix D
Notes: L_{eq} = equivalent continuous sound level (time-averaged sound level); L_{max} = maximum sound level during the measurement interval

Local Noise Regulations

The project site is located in the City of Gardena. The nearest noise-sensitive land uses are located in the City of Torrance. Therefore, the noise regulations from both municipalities are summarized below.

Gardena General Plan

The Noise Plan (City of Gardena 2006f), in the general plan's Community Safety Element, contains recommended compatibility noise guidelines for a variety of land uses and would apply in usable outdoor space such as patios, yards, spas, etc. The guidelines recommend that an exterior noise level of 60 dB CNEL is considered a "normally acceptable" noise level for single-family, duplex, and multifamily uses involving normal conventional construction, without any special noise insulation requirements. Exterior noise levels up to 65 dB CNEL are typically considered "conditionally acceptable," and residential construction should only occur after a detailed analysis of the noise reduction requirements is made and needed noise attenuation features are included in the project design. Exterior noise attenuation features include but are not limited to setbacks to place structures outside the conditionally acceptable noise contour, orienting structures so no windows open to the noise source, and /or installing noise barriers such as berms or solid walls.

Gardena Municipal Code

The City of Gardena's noise ordinance (Gardena Municipal Code chapter 8.36, Noise) is designed to protect people from non-transportation (stationary) noise. The ordinance sets limits on the level and the duration a stationary noise source may impact an adjoining residential use. Ordinance limits generally apply to "stationary" sources such as mechanical equipment, or vehicles operating on private property. The City's noise standards are summarized in Table 10, City of Gardena Exterior and Interior Noise Limits (dBA).

Table 10. City of Gardena Exterior and Interior Noise Limits (dBA)

	Allowable Exterior Noise Level[a]			
	15-Minute Average Level (L_{eq})		*Maximum Level (L_{max})*	
Type of Land Use	*7 a.m.–10 p.m.*	*10 p.m.–7 a.m.*	*7 a.m.–10 p.m.*	*10 p.m.–7 a.m.*
Residential	55	50	75	70
Residential portions of mixed-use	60	50	80	70
Commercial	65	60	85	80
Industrial or manufacturing	70	70	90	90

Source: Gardena Municipal Code (Section 8.36.040)
[a] Land use noise level (dBA) at property line

Pursuant to City of Gardena Municipal Code section 8.36.080, Exemptions, noise from construction, repair, remodeling, grading, or demolition of any real property is exempt from the City's noise standards, provided said activities do not take place between the hours of 6 p.m. and 7 a.m. on weekdays, between the hours of 6 p.m. and 9 a.m. on Saturday, or any time on Sunday or a federal holiday.

City of Torrance General Plan Noise Element

The Noise Element of the City of Torrance's general plan (City of Torrance 2010) is the guiding document for the City's noise policy and contains four objectives, N.1 through N.4, with accompanying policies, designed to protect residents and businesses from excessive and persistent noise intrusions. Objectives and policies relevant to the proposed project are as follows:

Objective N.1: To identify noise pollution and establish effective noise abatement methods.

Policy N.1.1: Continue to strictly enforce the provisions of the City's Noise Ordinance to ensure that stationary noise, traffic-related noise, railroad noise, airport-related noise, and noise emanating from construction activities and special events are minimized.

Policy N.1.4: Minimize unnecessary outdoor noise through enforcement of the noise ordinance and through permit processes that regulate noise-producing activities.

Objective N.3: To minimize noise incompatibilities between land uses.

Policy N.3.1: Review industrial, commercial, or other noise-generating land use proposals for compatibility with nearby noise-sensitive land uses, and require that appropriate mitigation be provided.

Policy N.3.2: Require the inclusion of noise-reducing design features for developments near noise-sensitive land uses.

Policy N.3.4: Work with property and business owners to avoid or resolve noise incompatibilities in commercial or industrial areas.

Objective N.4: To research and implement new means of noise abatement.

Policy N.4.1: Encourage and support efforts by the State of California to abate noise pollution by using stricter quantitative noise standards, shorter compliance time governing operation of all types of motor vehicles, etc.

Policy N.4.2: Maintain open lines of communication between the City and all federal, State, and County agencies involved in noise abatement.

Policy N.4.3: Educate residents and businesses of the effects of noise pollution, ways they can assist in noise abatement, and noise abatement programs within the City.

[a] features in project design and construction.
[b] Maximum exterior noise levels up to 70 dB CNEL are allowed for Multiple-Family Housing.
[c] Regarding aircraft-related noise, the maximum acceptable exposure for new residential development is 60 dBA CNEL.

City of Torrance Municipal Code

Torrance Municipal Code chapter 6, Noise Regulation, regulates stationary noise sources within the City limits. The noise standards (specified according to geographical location) shown in Table 12, City of Torrance Stationary Noise Standards, regulate the impact of stationary noise sources to a neighboring private property. The nearest noise-sensitive land uses (residences) are located within Region 4.

Table 12. City of Torrance Stationary Noise Standards

Region[a]	Exterior Noise Level (dBA) $L_{eq(h)}$

Region 2	60	55
Region 3	50	45
Region 4	55	50

Source: City of Torrance 2008.
[a] The nearest noise-sensitive land uses (residences) are located within Region 4.

In addition, Torrance Municipal Code section 46.2.6, Machinery, Equipment, Fans, and Air Conditioning, states: "It shall be unlawful for any person to operate any machinery, equipment, pump, fan, air conditioning apparatus or similar mechanical device in any manner so as to create any noise which would cause the noise level at the property line of any residential land to exceed the ambient noise level by more than five (5) decibels".

Torrance Municipal Code section 46.3.1, Construction of Buildings and Projects, subsection (a) states: "It shall be unlawful for any person within the city of Torrance to operate power construction tools, equipment, or engage in the performance of any outside construction or repair work on buildings, structures, or projects in or adjacent to a residential area involving the creation of noise beyond 50 decibels (dB) as measured at property lines, except between the hours of 7:30 a.m. to 6:00 p.m. Monday through Friday and 9:00 a.m. to 5:00 p.m. on Saturdays. Construction shall be prohibited on Sundays and Holidays observed by City Hall. An exception exists between the hours of 10:00 a.m. to 4:00 p.m. for homeowners that reside at the property.

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less-Than-Significant Impact. On-site noise-generating activities associated with the proposed project would include short-term construction and long-term operational noise.

Construction Noise (Short-Term Impacts)

Construction noise and vibration are temporary phenomena. Construction noise and vibration levels vary from hour to hour and day to day, depending on the equipment in use, the operations being performed, and the distance between the source and receptor.

Project construction is anticipated to commence in July 2021 and would last approximately 30 months. Construction of the upgraded pumping plant would involve deep excavation of the dry/wet well; installation of the new influent cross connections, manhole, pumps, and discharge piping; and construction of a new superstructure over the dry/wet well.

The equipment used during construction would include an excavator, a backhoe, an off-road forklift, a crane, and haul trucks. This is standard equipment that would be employed for any routine construction project of this scale; construction equipment with substantially higher noise-generation characteristics (such as pile drivers, rock drills, and blasting equipment) would not be necessary.

Construction noise is difficult to quantify because of the many variables involved, including the specific equipment types, size of equipment used, percentage of time each piece is in operation, condition of each piece of equipment, and the number of pieces that would operate on the project site. The typical maximum noise levels for various pieces of construction equipment at a distance of 50 feet are presented in Table 13, Construction Equipment Maximum Noise Levels. Note that the equipment noise levels presented in Table 13 are maximum noise levels. Typically, construction equipment operates in alternating cycles of full power and low power, producing average noise levels less than the maximum noise level. The average sound level of construction activity also depends on the amount of time that the equipment operates and the intensity of construction activities during that time.

Table 13. Construction Equipment Maximum Noise Levels

Equipment	Maximum Sound Level (dBA) 50 feet from Source
Air compressor	81
Backhoe	80
Compactor	82

Table 13. Construction Equipment Maximum Noise Levels

Equipment	Maximum Sound Level (dBA) 50 feet from Source

Pneumatic tool	85
Pump	76
Roller	74
Saw	76
Truck	88

Source: U.S. DOT 2018

The maximum noise levels at 50 feet for typical construction equipment would range up to 89 dBA for the type of equipment normally used for this type of development project, although the hourly noise levels would vary. Construction noise in a well-defined area typically attenuates at approximately 6 dBA per doubling of distance.

The Federal Highway Administration's (FHWA) Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate construction noise levels at the nearest noise-sensitive receivers (the nearest residences, located approximately 320 feet to the west, and a nearby church, located approximately 450 feet to the southwest). Although the model was funded and promulgated by FHWA, the RCNM is often used for non-roadway projects, because the same types of construction equipment used for roadway projects are also used for other project types. Input variables for the RCNM consist of the receiver/land use types, the equipment type and number of each (e.g., two graders, a loader, a tractor), the duty cycle for each piece of equipment (e.g., percentage of hours the equipment typically works per day), and the distance from the noise-sensitive receiver. No topographical or structural shielding was assumed in the modeling. The RCNM has default duty-cycle values for the various pieces of equipment, which were derived from an extensive study of typical construction activity patterns. Those default duty-cycle values were used for this noise analysis.

Using FHWA's RCNM construction noise model and construction information (types and number of construction equipment by phase), the estimated noise levels from construction were calculated for the distances to the nearest noise-sensitive receivers (the nearest residences and the church), as presented in Table 14, Construction Noise Model Results Summary. The RCNM inputs and outputs are provided in Appendix D.

Table 14. Construction Noise Model Results Summary

Construction Phase	Construction Noise at Representative Receiver Distances (L_{eq}, dBA)	
	Residences to the West (approx. 320 feet away)	*Church to the Southwest (approx. 450 feet away)*
Demolition of On-Site Buildings	63	61
Grading/Trenching	64	61
Building Construction	61	58
Architectural Coatings	53	50
Demolition of Existing Pumping Station	64	61
Paving	61	59

Source: Appendix D
Notes: L_{eq} = equivalent continuous sound level; N/A = not applicable; no heavy construction equipment would be used for this phase.

As presented in Table 14, the highest noise levels are predicted to occur during grading and demolition, when noise levels from construction activities would be as high as approximately 64 dBA L_{eq} (equivalent continuous sound level) at the nearest residences, and 61 dBA L_{eq} at the church. During other phases of construction, construction noise would range from approximately 50 to 63 dBA L_{eq}.

Construction activity on the project site would adhere to City of Gardena's limits on hours of construction, taking place between 7 a.m. and 6 p.m. Monday through Friday, between 9 a.m. and 6 p.m. on Saturday, and would not take place on Sundays or holidays.

Although nearby noise-sensitive land uses would be exposed to construction noise levels, the exposure would be relatively low; ambient daytime noise levels at these locations are substantially higher (ranging from 71 to 74 dBA L_{eq}). Additionally, the noise from construction would be short-term and intermittent throughout the construction timeframe, and would cease upon project construction. It is anticipated that construction activities associated with the proposed project would take place during the time periods required by the City of Gardena and the City of Torrance construction noise standards. Therefore, noise impacts from construction would be less than significant. No mitigation measures are required.

Operational Noise (Long-Term Impacts)

Less-Than-Significant Impact. As discussed in Section 2.3, the proposed project would consolidate the existing East and West Plants into one new pumping plant adjacent to the existing location. The existing equipment would be replaced with newer, more-efficient equipment, and the overall pumping capacity would remain the same. As technology has improved over time, mechanical noise levels have been reduced because mechanical noise and vibration represent wasted energy. Additionally, rather than the current condition in which two pumps operate simultaneously, only one pump would operate under the proposed project. The existing structure would also be replaced by a newly-constructed structure.

Based upon field observations and noise measurements, the noise from the existing pumping facilities is not audible from outside the plant. Because the project would replace the existing facility with new, more-efficient, quieter equipment and the equipment would be housed within a new structure designed to be at least as quiet as the existing structure, the noise level from the proposed project would not

result in a substantial noise increase; rather, the noise from the proposed project would in all likelihood be less than from the existing facility. Therefore, the noise impact from operation of the proposed project would be less than significant.

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Less-Than-Significant Impact. Construction activities that might expose people to excessive groundborne vibration or groundborne noise could cause a potentially significant impact. Groundborne vibration information related to construction activities has been collected by Caltrans (Caltrans 2013). Caltrans indicates that transient vibrations (such as construction activity) with a peak particle velocity of approximately 0.035 inches per second may be characterized as barely perceptible, and vibration levels of 0.24 inches per second may be characterized as distinctly perceptible. The heavier pieces of construction equipment, such as bulldozers, would have peak particle velocities of approximately 0.089 inches per second or less at a distance of 25 feet (U.S. DOT 2018). Groundborne vibration is typically attenuated over short distances.

At the nearest existing noise-sensitive land use distance to the nearest construction area (approximately 320 feet) and with the anticipated construction equipment, the peak particle velocity would be approximately 0.002 inches per second. This vibration level would be well below the threshold of "barely perceptible" of 0.035 inches per second vibration, as well as the typical vibration threshold for potential building damage of 0.5 inches per second or greater for buildings of reinforced-concrete, steel, or timber construction. Groundborne vibration would not be associated with the proposed project following construction activities; the water pumps would not generate substantial levels of vibration. Impacts related to groundborne vibration would be less than significant.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

No Impact. The project site is not located within an airport land use plan (Los Angeles County Airport Land Use Commission 2004). The nearest airport to the project site is Hawthorne Municipal Airport, located approximately 3.6 miles northeast of the project site in the city of Hawthorne. As such, the proposed project would not be located within 2 miles of a public airport. In addition, the project site is not within the Airport Influence Area for Hawthorne Municipal Airport; the proposed project would not expose people residing or working in the project area to excessive noise levels. In addition, the proposed project would not be located within the vicinity of a private airstrip. Therefore, no noise impacts would result because of airports or private airstrips.

3.14 Population and Housing

a) Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

No Impact. The proposed project would address the existing safety, reliability, and maintenance issues of the existing Gardena Pumping Plant by consolidating the East and West Plants into one new pumping plant near

the existing location. The Districts anticipate that construction workers would come from the surrounding region and that the proposed project would not induce population growth or require permanent housing. Once completed, no housing is proposed and no additional employees would be required.

Upon the completion of construction, the proposed project would include the continuation of the operation of the District's pumping plant to handle sewage flow. The proposed project does not propose housing or an increase in employment; therefore, the proposed project would not directly induce population growth. The proposed project does not propose to increase the capacity of the existing sewer system or extend the existing infrastructure into a previously undeveloped area. Thus, the proposed project would not indirectly induce population growth. Therefore, no impact associated with population growth would occur.

b) Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No Impact. The proposed project would be located within a predominately commercial area, and would not require the demolition or alteration of existing housing. The proposed project would not displace people or require replacement housing. Therefore, people and housing would not be displaced, and no impact would occur.

3.15 Public Services

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

Fire protection?

No Impact. The City maintains a contractual agreement with the Los Angeles County Fire Department to provide fire protection and emergency medical services for the City. Within the City, the Los Angeles County Fire Department operates Fire Station 158, located at 1650 West 162nd Street, and Fire Station 159, located at 2030 West 135th Street. Fire Station 158 covers areas south of Marine Avenue, such as the project site. Fire Station 158 staffs five uniform personal, one secretary, one community service representative, and one division nurse. On-site services and equipment include a fire engine, paramedic mobile aid van, squad car, and fire engine on reserve (City of Gardena 2006d).

The proposed project involves upgrades to an existing pump station to address the existing safety, reliability, and maintenance issues. The proposed project would be designed to comply with applicable local, regional, and state requirements related to emergency access. In addition, the Districts would obtain an encroachment permit from the cities of Gardena and Torrance to ensure coordination with emergency service providers during construction. This coordination would ensure that sufficient emergency service, access, and evacuation would be provided during construction, if necessary. The proposed project operations would be the same as those under the existing conditions; thus, the proposed project would not generate requirements for additional fire protection services. The project site would continue to be served by Fire Station 158, located approximately 1.2 miles northeast via local

roads. The proposed project would not result in additional facilities or fire services to maintain an adequate LOS. Therefore, no impact associated with fire protection services would occur.

Police protection?

No Impact. The Gardena Police Department, located within the Civic Center (1718 West 162nd Street), provides police protection and law enforcement services to the City. There are currently 83 police officers and 19 part-time employees. Response times for emergency calls throughout the City is 4 minutes (City of Gardens 2006d).

The proposed project involves upgrades to an existing pump station to address existing safety, reliability, and maintenance issues. As such, the proposed project would not introduce a residential population, which would directly result in increased calls for police protection services. In addition, the Districts would obtain an encroachment permit from the cities of Gardena and Torrance to ensure coordination with law enforcement during construction. This coordination would ensure that sufficient emergency service, access, and evacuation would be provided during construction if necessary. The same operations that presently occur at the project site would continue upon completion of construction, and no additional operations or maintenance employees would be required. Construction of the proposed project would not change local police protection or emergency vehicle response times or affect demand for police protection services in the project area. Therefore, no impact associated with police protection services would occur.

Schools?

No Impact. The proposed project would not involve a housing component that would result in population growth and increased demands on existing schools within the area. Operations associated with the proposed project would be the same as compared to the existing conditions, and no additional employees would be required. Therefore, the proposed project would not generate a demand for school services or induce population growth such that new school facilities would be required, and no impact to schools would occur.

Parks?

No Impact. The proposed project would not involve a housing component or increase employment to result in population growth. Operations associated with the proposed project would be the same as those under existing conditions, and no additional employees would be required. Therefore, no additional demands or impacts upon existing public parks would occur because of project implementation.

Other public facilities?

No Impact. The proposed project would not involve a housing component or increase employment opportunities that would result in population growth within the City. Operations associated with the proposed project would be the same as those under existing conditions, and no additional employees would be required. Therefore, no additional demands on other public facilities, such as library or health care services, and no impact would occur because of project implementation.

3.16 Recreation

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

No Impact. As discussed previously in Section 3.14, the proposed project would not directly or indirectly introduce population growth. Therefore, the proposed project would not generate demand for recreational facilities, nor would the project generate population growth that would cause physical deterioration of existing facilities. No impact would occur.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

No Impact. The proposed project involves upgrades to an existing pump station to address existing safety, reliability, and maintenance issues. As such, the proposed project does not include recreational facilities. Operations associated with the proposed project would be the same as those under existing conditions, and no additional employees would be required. Therefore, the proposed project would not generate demand for recreational facilities, nor would it generate population growth such that new or expanded recreational facilities would be required. No impact would occur.

3.17 Transportation

The following provides background information for the transportation analysis.

Project Study Area

The project study area is composed of the segment of Artesia Boulevard, between Gramercy Place and Western Avenue, at the borders of the cities of Gardena and Torrance. The project site is on the north side of Artesia Boulevard and lies within the City of Gardena. However, the roadway segment of Artesia Boulevard in the study area lies within the city of Torrance up to Western Avenue; east of Western Avenue, Artesia Boulevard is within the city of Gardena.

Existing Conditions

The following presents a description of the existing street network conditions in the study area.

Street Network

Artesia Boulevard is classified as a Major Arterial under the City of Torrance General Plan, Circulation and Infrastructure Element (2010). Major Arterials link roadways to major corridors such as Principal Arterials. These arterials can accommodate trips and capacity at a lower level than Principal Arterials. Direct access to adjacent parcels should be minimized to maximize speed and limit interference with flow. Between Gramercy Place and Western Avenue, Artesia Boulevard is a four- to six-lane, divided roadway with a posted speed limit of 45 miles per hour (mph). Time-restricted, on-street parking is allowed in marked areas along either side of the street.

Western Avenue is classified as a Major Arterial north of Artesia Boulevard under the City of Torrance General Plan, Circulation and Infrastructure Element. South of Artesia Boulevard, Western Avenue is located within the City of Gardena and is classified as an Arterial by the City of Gardena, Community Development Element, Circulation Plan (2006). Western Avenue is a four-lane, undivided roadway with a two-way left-turn lane both north and south of Artesia Boulevard. Western Avenue has a posted speed limit of 40 mph. On-street parking is provided along some segments along either side of the roadway, with some time-restricted areas.

Gramercy Place is classified as a Local Street under the City of Torrance General Plan, Circulation and Infrastructure Element. Local Streets provide direct access to individual parcels and are not designated for through traffic. Gramercy Place is a two-lane roadway with a posted speed limit of 25 mph. On-street parking is provided along most stretches along either side of the roadway with some time-restricted zones.

Bicycle and Pedestrian Facilities

The City of Torrance General Plan, Circulation and Infrastructure Element, Bicycle Master Plan establishes the following three bikeway classifications:

- **Class I bikeways** are identified as off-road routes that are located along designated multiuse trails or obsolete rail lines. These bikeways are separated from streets.
- **Class II bike lanes** are identified as on-road routes that are located along arterial roadways and are delineated by painted stripes and other features.
- **Class III bike routes** are identified as on-road routes that provide shared use with pedestrians or motor vehicle traffic. Class III bike routes are indicated by signage but are not striped.

Adjacent to the project site, Artesia Boulevard is not indicated as a Class I, II, or III bikeway facility, nor are bicycle facilities proposed along Artesia Boulevard under the Bicycle Master Plan. Van Ness Avenue, a north–south Minor Arterial located approximately 0.25 miles west of Gramercy Boulevard, is the nearest bicycle facility to the project site. Van Ness Avenue is identified as a Class III bike route in the Bicycle Master Plan.

Pedestrian facilities are provided along Artesia Boulevard, with sidewalks ranging from 5 to 10 feet in width in the vicinity of the project site.

Transit System

The Torrance Transit System provides a general-purpose fixed-route bus system, as well as demand responsive services for seniors and the disabled. The fixed-route service area includes all of Torrance, with routes going into downtown Long Beach, and another serving the Metro Blue Line station in Compton. Torrance Transit also serves Union Station in downtown Los Angeles.

Torrance Routes 2 and 5 are the nearest routes to the project site, serving Van Ness Avenue and Artesia Boulevard west of Crenshaw Boulevard; however, the Torrance Transit system does not serve Artesia Boulevard adjacent to the project site. The Los Angeles County Metropolitan Transportation Authority (LA Metro) Route 130 provides fixed-route bus service to this area. Route 130 provides Monday through Sunday service along Artesia Boulevard, from Redondo Beach to Cerritos. Weekday service runs from approximately 5 a.m. through 10 p.m., with service every 10 to 15 minutes. Service is limited on weekends and holiday. Eastbound and westbound stops for Route 130 are provided at the Gramercy Place/Artesia Boulevard and Western Avenue/Artesia Boulevard intersections.

SB 743

On September 27, 2013, SB 743 was signed, creating a process that changes the method for analyzing transportation impacts under CEQA. SB 743 requires that the Governor's Office of Planning and Research (OPR) amend the CEQA Guidelines to provide an alternative to LOS for evaluating transportation impacts. Under the new transportation guidelines, LOS, or automobile delay, will no longer be considered an environmental impact under CEQA. Per OPR's Final Proposed Updates to the CEQA Guidelines, adopted in December 2018, several changes to the questions related to transportation in CEQA Guidelines Appendix G were made. First, OPR revised the question related to "measures of effectiveness" (threshold question A) so that the analysis focuses on circulation elements of city and county general plans and other land use plans governing transportation. Second, OPR deleted the second question related to LOS and insert references to proposed new section 15064.3. Third, OPR clarified the question related to design features.

The new section 15064.3(b), "Criteria for Analyzing Transportation Impacts," states, "If existing models or methods are not available to estimate the vehicle miles traveled for the particular project being considered, a lead agency may analyze the project's vehicle miles traveled qualitatively. Such a qualitative analysis would evaluate factors such as the availability of transit, proximity to other destinations, etc. For many projects, a qualitative analysis of construction traffic may be appropriate."

OPR's regulatory text indicates that a public agency may immediately commence implementation of the transportation impact guidelines, and that the guidelines shall apply statewide by January 1, 2020. The following analysis section uses the recently updated significance thresholds included in CEQA Guidelines Appendix G.

a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

Less-Than-Significant Impact. As discussed previously in Section 3.13, Noise, under the noise standards of the cities of Gardena and Torrance, if construction noise is to occur outside of the hours of 7:30 a.m. to 6 p.m. Monday through Friday, and 9 a.m. to 5 p.m. on Saturdays, extended-hours permits would be required. Nighttime and weekend construction, although infrequent, may occur. Additional construction assumptions are provided in Section 2.3 of this IS/MND.

Trips generated by construction workers were conservatively assumed to be generated during the weekday AM (arriving to the site) and PM (leaving the site) peak hours. The delivery trucks and haul trucks were assumed to be distributed evenly throughout the work shift. Based on estimates of the maximum number of construction workers and delivery and haul trucks for each construction phase (i.e., demolition, grading, building construction, architectural coating, paving, etc.), the phase that would generate the highest volume of traffic would be the site grading phase. Table 15, Peak Construction Phase Trip Generation, provides the project trip generation for the peak construction phase.

Table 15. Peak Construction Phase Trip Generation

Vehicle Type	Daily Quantity	Daily Trips	AM Peak Hour			PM Peak Hour		
			In	*Out*	*Total*	*In*	*Out*	*Total*
Trip Generation								
Grading								
Construction Workers	10 workers	20	10	0	10	0	10	10
Delivery trucks	0 trucks	0	0	0	0	0	0	0
Haul trucks	10 trucks	20	2	2	4	2	2	4
	Total	**40**	**12**	**2**	**14**	**2**	**12**	**14**
Trip Generation with PCE								
Grading								
Construction Workers (1.0 PCE)	10 workers	20	10	0	10	0	10	10
Delivery trucks (2.0 PCE)	0 trucks	0	0	0	0	0	0	0
Haul trucks (3.0 PCE)	10 trucks	60	6	6	12	6	6	12
	Total (w/ PCE)	**80**	**16**	**6**	**22**	**6**	**16**	**22**

Source: Appendix A.
Notes: PCE = passenger-car equivalent

As shown in Table 15, the peak construction phase of the project is expected to generate approximately 40 daily trips during the peak period of construction, with 14 AM peak-hour trips (12 inbound and 2 outbound), and 14 PM peak-hour trips (2 inbound and 12 outbound). With the application of passenger-car equivalence (PCE) factors to truck trips, the proposed project would generate 80 PCE daily trips, with 22 PCE trips during the AM peak hour (16 inbound and 6 outbound) and 22 PCE trips during the PM peak hour (6 inbound and 16 outbound).

With the conservative PCE adjustment, the peak construction phase would generate less than 100 daily trips, and less than 25 peak-hour trips. When added to the street network, these trips would not have a measurable impact, and would not significantly impact any LOS thresholds in the Cities of Torrance and Gardena. Additionally, because construction is temporary, all trips associated with project construction would cease after installation of the pumping plant. Any trips associated with operational activities would be limited to scheduled maintenance and repair, and would result in negligible (nominal) traffic to the study area.

The Los Angeles County Congestion Management Program (CMP) requires evaluation of all CMP arterial monitoring intersections where the project would add 50 or more new peak-hour trips. As shown in Table 15, construction of the proposed project would generate 14 trips in both peak hours (22 trips when adjusted with PCE) and therefore would not require a CMP analysis. Additionally, operational activities required for scheduled maintenance and repair would not generate 50 or more new peak-hour trips, as they would be minimal, intermittent, and similar to those that occur throughout the District's service area under existing conditions. Since the project would not result in the generation of additional future traffic, conflicts with an applicable congestion management program or standards would not occur during operation.

Open Trenching

Construction of the proposed project may require the use of an open-trench construction method along the project's frontage on Artesia Boulevard. The general process for open-trenching consists of utility clearance/mark-out activities, site preparation, excavation, shoring, pipe installation, backfilling, and work area street restoration. Construction staging would occur on the streets where the construction is taking place. Equipment and materials may be staged in the parking lanes of the roadway, and some encroachment may occur along sidewalks.

The *Work Area Traffic Control Handbook* (WATCH) *Manual* would be implemented for construction within roadways, and traffic control plans would be designed and approved by the City of Gardena and/or City of Torrance for traffic during construction. Work areas would be barricaded with chain-linked fences during the day to prevent vehicles and pedestrians from entering work areas during construction hours. Construction fencing would be removed at night. Open trenches would be plated during non-construction hours. Roadways along commercial areas would be partially closed. However, travel would always be maintained in each direction. These lane closures would be temporary, and separate work areas would not generally be established adjacent to each other, thereby minimizing the size of each closure. Impacts would be less than significant.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Less-Than-Significant Impact. CEQA Guidelines Section 15064.3, subdivision (b), focuses on specific criteria (VMT), for determining the significance of transportation impacts. It is further divided into four subdivisions: (1) land use projects, (2) transportation projects, (3) qualitative analysis, and (4) methodology. The proposed project is a pumping plant project that would generate temporary construction-related traffic and nominal operations and maintenance traffic. This project would be categorized under subdivision (b)(3), qualitative analysis. Subdivision (b)(3) recognizes that lead agencies may not be able to quantitatively estimate VMT for every project type. In those circumstances, this subdivision encourages lead agencies to evaluate factors such as the availability of transit, proximity to other destinations, and other factors that may affect the amount of driving required by the project.

As described previously, construction of the proposed project would result in a temporary increase in local traffic as a result of construction-related workforce traffic and material deliveries, and construction activities occurring within the public right-of-way. The primary off-site impacts from the movement of construction trucks would include short-term and intermittent effects on traffic operations because of slower movements and larger turning radii of delivery and haul trucks compared to passenger vehicles.

Potential increases in vehicle trip generation as a result of project construction would vary based on the construction activity (phase), equipment needs, and other factors. However, once construction is completed, construction-related traffic would cease and VMT levels would return to pre-project conditions. Therefore, the proposed project would not conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). Impacts would be less than significant.

c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less-Than-Significant Impact With Mitigation Incorporated. During construction, lane closures, roadway closures, detours, driveway blockages, loss of parking, and disruptions to traffic, transit, bicycle, and pedestrian movement would occur around the project site. This may result in a potentially significant safety hazard to construction workers and/or the public; therefore, mitigation would be required. To minimize these potential safety hazards, mitigation measure MM-TRAF-1 would be implemented.

MM-TRAF-1 **Construction Traffic Management Plan.** Prior to the start of any construction-related work or encroachment, the Districts shall develop and implement a Construction Traffic Management Plan. The Construction Traffic Management Plan shall include, but will not be limited to, the following measures:

1. All construction activities shall be conducted in accordance with the Greenbook, traffic control plans designed by the Cities of Torrance and/or Gardena, and the *Work Area Traffic Control Handbook Manual* (WATCH) to reduce any impacts to levels of service, traffic safety, and emergency access to the site during construction.
2. The Districts shall install temporary equipment and measures necessary for safe and efficient traffic control including changeable message signs, delineators, arrow boards, flagmen, etc.
3. The Districts shall provide advance notification of the proposed construction work area limits and lane closure times to transit services and all local emergency service providers (police, fire, ambulance, etc.).
4. Qualified flagmen shall be posted at each work site to direct construction traffic entering and exiting the site and/or to direct large construction-related vehicles to/from the work areas.
5. Two-way travel shall always be provided along Artesia Boulevard. During construction periods with reduced lane capacity, the Districts shall implement a Traffic Control Plan that includes detour routes around the impacted lane segments.
6. The Traffic Control Plans shall also include detours and safe passage areas for bicyclists and pedestrians in the impacted work areas.

The construction of the proposed project would be conducted in accordance with the Greenbook, traffic control plans designed by the Districts, and the WATCH Manual to allow acceptable LOS, traffic safety, and emergency access to the site during construction. With the implementation of mitigation measure MM-TRAF-1, impacts related to hazards during construction would be reduced to less-than-significant levels. Once operational, the maintenance and repair of the proposed project would be similar in nature to what is currently occurring for the existing pumping plant. Therefore, no new impacts would occur. As such, impacts would be limited to the construction period and would be less than significant with mitigation incorporated.

d) Would the project result in inadequate emergency access?

Less-Than-Significant Impact With Mitigation Incorporated. As discussed previously, construction vehicles would temporarily access the project site via Artesia Boulevard. The proposed project would have the potential to obstruct portions of this roadway during construction. However, incorporation of a Construction Traffic Management Plan, as required by mitigation measure MM-TRAF-1, and associated

traffic control plans and adherence to the Greenbook and WATCH Manual would ensure that any temporary impacts to emergency vehicle flow and/or ingress/egress to properties along Artesia Boulevard are coordinated in advance with emergency service providers and law enforcement so that sufficient emergency service, access, and evacuation will be provided during construction if necessary. Implementation of a Construction Traffic Management Plan with applicable traffic control plans and adherence to the Greenbook and WATCH Manual would reduce impacts to emergency access to less-than-significant levels. Once operational, the proposed project would not include any impediments to emergency access. Additionally, vehicular trips for maintenance and repair during operation of the pumping plant would be minimal and would be similar in quantity and nature to those currently occurring in the area for other District facilities. Therefore, no new impacts to emergency access would occur during operation. As such, impacts would be limited to the construction period and would be less than significant with mitigation incorporated.

3.18 Tribal Cultural Resources

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

Less-Than-Significant Impact. As discussed previously in Section 3.5, the Gardena Pumping Plant, Majestic Lighting building, and the E-S Technical Motorsports building were evaluated under NRHP/CRHR designation criteria. As a result of the background research, field survey, and property significance evaluations, the Gardena Pumping Plant, 1923 West Artesia Boulevard, and 1931 West Artesia Boulevard buildings do not appear to be eligible for the NRHP or CRHR due to a lack of significant historical associations, architectural merit, and/or compromised integrity. Therefore, these properties are not considered historical resources for the purposes of CEQA.

No tribal cultural resources (either listed or eligible for listing) were identified within the project site as a result of the CHRIS records search, NAHC Sacred Lands File search, or Native American outreach efforts. Therefore, there would be no impacts associated with historical resources listed or eligible for listing in the CRHR or a local register of historical resources.

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Less-Than-Significant Impact With Mitigation Incorporated. The Sacred Lands File search conducted by the NAHC to failed to indicate the presence of Native American cultural resources for the project site. The NAHC provided a list of five Native American groups and individuals who

may have knowledge of cultural resources in the project area. Letters regarding the proposed project were sent on January 29, 2019 to all five individuals listed on the NAHC consultation list.

All NAHC-listed California Native American Tribal representatives who have requested project notification pursuant to AB 52 (Public Resources Code Section 21074) were sent letters by the Districts in February 2019. The letters contained a project description, outline of AB 52 timing, request for consultation, and contact information for the appropriate lead agency representative. One request for consultation was received February 14, 2019 from Native American representative Andrew Salas from the Gabrieleño Band of Mission Indians – Kizh Nation. On March 21, 2019, a phone consultation took place between the District and a Native American representative from the Gabrieleño Band of Mission Indians-Kizh Nation. Based on the consultation and because of the Native American representative's concerns regarding the potential discovery of tribal resources, should any tribal cultural resources be uncovered during construction, resources would be treated in accordance with mitigation measures MM-TCR-1, MM-TCR-2, and MM-TCR-3. Therefore, MM-TCR-1, MM-TCR-2, and MM-TCR-3 are recommended to reduce potential impacts to tribal cultural resources to less-than–significant levels.

MM-TCR-1 To reduce potential impacts to unanticipated tribal cultural resources (TCRs) during project implementation, all construction personnel shall undergo Worker Environmental Awareness Program (WEAP) training to ensure that any unanticipated TCR discoveries are treated appropriately. The WEAP training shall provide specific details on the kinds of Native American cultural resources that may be identified during ground-disturbing activities.

Additionally, the County Sanitation District No. 5 of Los Angeles County (District), pursuant to Assembly Bill (AB) 52, has reviewed information provided through technical reports and consultations with California Native American tribes. Based on these discussions, the District shall invite the Gabrieleño Band of Mission Indians – Kizh Nation (Gabrieleño) to provide a qualified Native American monitor. The Native American monitor will be accompanied by an archaeological monitor retained by the District or the construction contractor. Monitors will be present part-time to observe initial disturbance of subsurface soils, and to continue to assess the site's potential to contain TCRs, as follows:

i) Soils beneath the paved parking and landscaped areas of the proposed project site will be monitored full-time to a maximum depth of 5 feet below the existing ground surface.

ii) If no TCRs have been identified within soils to this depth, monitoring will be reduced to no more than once a week, continuing at this frequency to a depth of 30 feet below the surface.

iii) District staff, based on ongoing review of observed subsurface conditions and information provided by Native American and archaeological monitors, may adjust monitoring strategies (increase, decrease, or discontinue), as appropriate.

iv) Should a potential TCR be inadvertently encountered, all construction work involving ground disturbance occurring within the vicinity of the find shall immediately stop and the District be notified. If the unanticipated resource is archaeological in nature,

appropriate management requirements shall be implemented as outlined in MM-CUL-2 in conjunction with the following provisions specific to the management of TCRs. Depending on the nature of the find, if the District determines, pursuant to California Public Resources Code Section 21074 (a)(2), that the find appears to be a TCR in its discretion and is supported by substantial evidence, the affected tribe shall be provided a reasonable period of time to make recommendations. The District will review recommendations and move forward with management options determined to be reasonable and feasible. The project may resume ground-disturbing activities near the find after it has complied with these recommendations.

v) Native American and archaeological monitors shall document monitoring activities with daily logs and photograph disturbed soils to document compliance with MM-TCR-1 through 3. These logs, prepared by a qualified archaeologist, shall be appended to a monitoring summary letter report before being submitted to the District within 3 months of completion of monitoring.

MM-TCR-2 Although no tribal cultural resources (TCRs) have been identified that may be affected by the project, the following approach for the inadvertent discovery of TCRs has been prepared to ensure there are no impacts to unanticipated resources. Should a potential TCR be encountered during construction activities, all work in the immediate vicinity of the discovery (within 50 feet) shall cease, the Districts shall be notified, and a qualified archaeologist meeting Secretary of Interior standards shall assess the find. The Districts shall notify Native American tribes consulting under Assembly Bill (AB) 52. If the potential resource is archaeological in nature, appropriate management requirements shall be implemented, as outlined in Mitigation Measure **MM-TCR-1**. If the Districts determines that the potential resource is a TCR (as defined by PRC, Section 21074), tribes consulting under AB 52 shall be provided a reasonable period of time, typically 5 days from the date that a new discovery is made, to conduct a site visit and make recommendations regarding future ground disturbance activities and the treatment and disposition of any discovered TCRs. Depending on the nature of the resource and tribal recommendations, review by a qualified archaeologist may be required. Implementation of proposed recommendations shall be made based on the determination of the Districts that the approach is reasonable and feasible. Work on the other areas of the project site outside of the buffered area may continue during this assessment period. All activities shall be conducted in accordance with regulatory requirements.

MM-TCR-3 If significant Native American cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, a qualified archaeologist shall be retained to develop a Cultural Resources Treatment Plan, the drafts of which shall be provided to the interested tribe(s) for review and comment.

(1) All in-field investigations, assessments, and/or data recovery enacted pursuant to the finalized Treatment Plan shall be monitored by a Native American monitor.

(2) The Districts shall, in good faith, consult with the interested tribe(s) on the disposition and treatment of any artifacts or other cultural materials encountered during the project.

3.19 Utilities and Service Systems

a) Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less-Than-Significant Impact. The proposed project involves consolidating the East Plant and West Plant of the existing Gardena Pumping Plan into one new pumping plant near the existing location. The proposed project involves replacement of the plant superstructure, replacement of pumps, deep excavation of the dry/wet well, improvement of force mains and cross connections, and upgrading of associated equipment. As such, the proposed project itself is a utility improvements project. For the reasons discussed below, the proposed project will result in less-than-significant impacts related to water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities.

Water Facilities

The proposed project would not generate water supply demand. As addressed in Section 3.14(a), the proposed project would not generate population growth and thus, would not require additional water supplies. Therefore, the proposed project would not require or result in the relocation or expansion of construction of new or expanded water facilities.

Wastewater Treatment Facilities

The Gardena Pumping Plant is part of the Districts' wastewater collection system. This pumping plant is located at a low point in the wastewater collection system and pumps flows from a lower to higher elevation, which allows the system to continue by gravity flow. Although the proposed project would result in construction of a part of the wastewater collection system, the construction would address existing safety, reliability, and maintenance issues of the existing pumping plant. The proposed project would not increase the capacity of the wastewater system, and would not result in the construction of new or expanded wastewater facilities. Upon the completion of construction activities, the proposed project will return to normal operations, which are the same as existing conditions. Further, the proposed project itself would not generate wastewater. Therefore, impacts related to the construction of new or expanded wastewater treatment facilities would be less than significant.

Stormwater Drainage Facilities

The proposed project involves upgrades to an existing pumping plant to address existing safety, reliability, and maintenance issues. The proposed project would be constructed within an already developed and impervious area. As such, the proposed project would not result in new impervious areas, and would not substantially change the amount of stormwater runoff from the project site and surrounding area. Therefore, the proposed project would not require or result in the relocation or expansion of construction of new or expanded stormwater drainage facilities.

Electric Power and Natural Gas Facilities

As discussed previously in Section 3.6, the proposed project would result in similar operations and, thus, similar energy use as under existing conditions. Because the proposed project would consolidate the operations of the pumping plant from two pumps to one pump, the energy required for the proposed project would be less than under existing conditions. Therefore, the proposed project would not result in the relocation or expansion of a new or expanded electric power or natural gas facility.

Telecommunications Facilities

The proposed project would not generate population growth and would not require telecommunications facilities. The proposed project involves the construction of a pumping plant, to replace an existing pumping plant. Further, the proposed project is in a largely developed area. Therefore, no impacts related to telecommunication facilities would occur.

b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?

Less-Than-Significant Impact. The proposed project would not generate demand for water supply. As addressed in Section 3.14(a), the proposed project would not generate population growth and thus, would not require additional water supplies. The proposed project would continue to operate under current conditions. Although construction would require water usage, the duration of that usage would be short-term and the amount required minimal. Therefore, impacts related to water supplies would be less than significant.

c) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less-Than-Significant Impact. As discussed previously in Section 3.19(a), the Gardena Pumping Plant is part of the Districts' wastewater collection system. Although the proposed project would result in the construction of a part of the wastewater collection system, the construction would address existing safety, reliability, and maintenance issues of the existing pumping plant. The proposed project would not increase the capacity of the wastewater system and would not generate additional wastewater. Therefore, impacts would be less than significant.

d) Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

No Impact. The proposed project would generate waste during construction. Once complete, the proposed project would not require solid waste material disposal. During construction, waste would be generated from demolition of the adjacent buildings, existing pumps, existing dry/wet wells, existing super structures, and other associated components. Consistent with Chapter 8.020.0606, Solid Waste Disposal and Diversion, of the City's Municipal Code, all construction and demolition projects are subject to a waste diversion performance standard in the percentage amount required by the State of the total waste generated (City of Gardena 2018). Further, the City has adopted a Source Recovery and Recycling Element as required by AB 939, to meet the waste diversion goals pertaining to demolition and construction waste. As such, the majority of construction waste, including that resulting from the demolition of portions of the existing Gardena Pumping Plant, would be diverted from landfills in addition to being minimal and short-term. The proposed

project would not generate ongoing solid waste in excess of the capacity of local infrastructure or otherwise impair the attainment of solid waste reduction goals. Therefore, there would be no impacts.

e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

No Impact. The proposed project would only generate waste during project construction. The construction contractor would be required to dispose of all construction waste as required by standard City specifications as well as any applicable federal and state requirements. Therefore, the proposed project would comply with federal, state and local reduction statutes and regulations related to solid waste and there would be no impacts.

3.20 Wildfire

a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

No Impact. According to the California Department of Forestry and Fire Protection's Fire Hazard Severity Zones maps, the project site is neither moderately, highly, nor very highly susceptible to wildland fire (CAL FIRE 2019). Upon the completion of construction, the project site would continue to operate as a pumping plant outside of the public right-of-way, and therefore, would not interfere with an emergency response plan or emergency evacuation plan. Therefore, no impacts would occur.

b) Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

No Impact. As previously addressed in Section 3.20(a), the project site is not located in a high fire hazard severity zone. The area surrounding the project site is generally urbanized and developed. There are no designated open space areas surrounding the project site. Land uses surrounding the proposed alignment include commercial, and some residential uses. Additionally, the proposed project involves the construction of a pumping plant and does not involve construction of a habitable structure, which would include project occupants. Therefore, no impacts would occur.

c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

No Impact. The proposed project is located within an urban area and is not susceptible to fire risk. In addition, the proposed project would not result in the installation or maintenance of roads, fuel breaks, emergency water sources, or power lines. Although the project itself involves the construction of utilities, there is not potential for exacerbating fire risk. Therefore, no impacts would occur.

d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact. As addressed in Section 3.20(a), the project site is not located in a high fire hazard severity zone. The proposed project is located on a generally level, built-out area and is not at risk of landslides or slope instability. Additionally, the proposed project does not involve the construction of structures that would be inhabited by people. Therefore, no impacts would occur.

3.21 Mandatory Findings of Significance

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

Less-Than-Significant Impact With Mitigation Incorporated. As discussed previously in Section 3.4, no native habitat is located on the project site or in the immediately surrounding area. On-site plant species are limited to non-native grasses and one tree located to the east of the existing plant superstructure. These non-native, ornamental plant species form a non-cohesive plant community that is not known to support any candidate, sensitive, or special-status plant species. No natural vegetation communities are present within the project site. Due to the urbanized nature of the project site, as well as the absence of wetlands located on-site, the proposed project would not result in substantial adverse effect on state or federally protected wetlands. Further, the project site is located within a highly urbanized area and would not interfere with the movement of any native residents, migratory fish, or wildlife species.

Regarding impacts related to important examples of the major periods of California history or prehistory, as further discussed in Section 3.5, the proposed project would not impact historical resources as defined by the CEQA guidelines and would not disturb human remains. However, it is always possible that intact archaeological deposits are present at subsurface levels. For this reason, the project site should be treated as potentially sensitive for archaeological resources. Therefore, mitigation measure MM-CUL-1 and MM-CUL-2 are recommended to reduce potential impacts to unanticipated archaeological resources to less than significant.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less-Than-Significant Impact With Mitigation Incorporated. The analysis below discusses the project's potential to make a cumulatively considerable contribution to an environmental impact, by resource. Where it has been determined based on the analysis in this IS/MND that no impact would occur in relation to specific resources (i.e., Agriculture and Forestry Resources, Mineral Resources, Population and Housing, Public Services, Recreation, and Wildfire), the project would inherently not result in a cumulatively considerable impact relative to those resources and no further discussion is provided below. Cumulative impacts for the other resource areas are discussed as follows:

Aesthetics

There would be no impacts to scenic vistas and scenic resources from the proposed project because the scenic vistas designated by the City of Gardena would not be obstructed by the project site, and no scenic highways are located within the vicinity of the project site. Cumulative impacts to existing visual character and lighting sources would be associated with the proposed project and surrounding uses. Each cumulative project would be required to comply with the Zoning Code, ensuring compatibility with the

surrounding uses. Through regulatory code compliance and applicable site plan review, each cumulative project would be constructed as approved and in a manner that is consistent with and compatible with the existing urban form and character of the surrounding environment. Further, the project site is separated from residences by existing commercial buildings; therefore, there would be little to no direct line of sight for glare to travel if sources of temporary glare (e.g., construction and operations and maintenance vehicles) are found on site. The proposed project's incremental contribution to a cumulative impact would not be considerable, and cumulative impacts to aesthetics would be less than significant.

Air Quality

Air pollution emissions, as defined by federal, state, and local agencies and regulations, are largely a cumulative impact. The nonattainment status for regional pollutants is a result of past and present development, and the SCAQMD develops and implements plans for future attainment of ambient air quality standards. In addition to SCAQMD's efforts, CARB has comprehensive regulatory programs in place for new and existing sources of air pollution.

The potential for the proposed project to result in a cumulatively considerable air quality impact is evaluated in Section 3.3(b). Air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and the SCAQMD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level thresholds of significance for criteria pollutants are used in the determination of whether a project's individual emissions would have a cumulatively considerable contribution on air quality. If a project's emissions exceed the SCAQMD significance thresholds, it would be considered to have a cumulatively considerable contribution. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant (SCAQMD 2003).

As discussed previously, the SCAB has been designated as a federal nonattainment area for O_3 and $PM_{2.5}$, and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SCAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operational activities of the proposed project would generate VOC and NO_X emissions (precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$. However, as indicated in Tables 4 and 5, project-generated emissions would be minimal and would not exceed the SCAQMD's emission-based significance thresholds for VOCs, NO_X, PM_{10}, or $PM_{2.5}$.

Cumulative localized impacts would potentially occur if a project were to occur concurrently with another off-site project. Schedules for potential future projects near the project area are currently unknown; therefore, potential impacts associated with two or more simultaneous projects would be considered speculative.[9] However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by the SCAQMD. Cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SCAQMD Rule 403 (Fugitive Dust), which sets forth general and specific requirements for all sites in the SCAQMD.

[9] The CEQA Guidelines state that if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145).

Therefore, the proposed project would not result in a cumulatively considerable increase in emissions of nonattainment pollutants, and impacts would be less than significant during construction and operation.

Biological Resources

Cumulative impacts to biological resources would occur where the construction or operation of the cumulative projects would encroach into areas containing sensitive biological resources, affect the movement of wildlife species, or affect the functionality of a planned conservation area. The proposed project would take place in a highly urbanized area. The project site contains several non-natural and disturbed land covers. As a result, the potential for special-status species is low, no natural vegetation communities are present, and no conflict with a habitat conservation plan would occur. The proposed project alone would not result in significant impacts to special-status biological resources. A significant impact to biological resources is typically based on consideration of the proposed project's impact on known sensitive species and/or the loss of valued habitat. Because the proposed project would not affect any rare, threatened, or endangered species, and would not result in the removal of any special-status native habitat, the majority of resultant cumulative impacts would also be considered less than significant.

Cultural Resources and Tribal Cultural Resources

Impacts to historic resources from the proposed project would be less than significant because there are no structures identified on the project site that meet local or state criteria for eligibility as a historical resource. Impacts to archaeological resources and tribal cultural resources would be potentially significant in the event of the inadvertent discovery of an archaeological resource during ground-disturbing activities. However, impacts would be less than significant because a qualified archaeologist would evaluate the discovery. Potentially significant impacts related to the inadvertent unearthing of human remains would be avoided by compliance with State Health and Safety Code Section 7050.5, which states that further disturbances and activities must stop in any area or nearby area suspected to overlie remains, and the County Coroner must be contacted.

Cumulative impacts to cultural resources evaluate whether the impacts of the proposed project and other related cumulative projects, when taken as a whole, substantially diminish the number of historical or archaeological resources within the same or similar context or property type. The proposed project could have potentially significant impacts to unknown archaeological and tribal cultural resources, and mitigation measures MM-CUL-1 and MM-CUL-2 and MM-TRC-1, MM-TCR-2, and MM-TCR-3 are included so that these impacts would be avoided. These determinations would be made on a case-by-case basis, and the effects of cumulative development on cultural resources would be mitigated to the extent feasible in accordance with CEQA and other applicable legal requirements. Therefore, the proposed project's impacts to cultural and tribal cultural resources would not be cumulatively considerable, since the impacts are site specific, have been assessed, and are less than significant. Other cumulative projects in the area would be mitigated at a project- and site-specific level; thus, there would be no cumulatively considerable impact.

Energy

The proposed project and cumulative projects would cumulatively increase the demand for electricity, natural gas, and petroleum. Regarding energy use, the proposed project would result in similar operations, and thus, similar energy demand as occurs under the existing conditions. Additionally, the

proposed project and cumulative projects would be required to comply with existing regulations governing energy use. Therefore, the proposed project's contribution to energy demand is not cumulatively considerable and impacts would be less than significant.

Geology and Soils

The geographic area considered for potential cumulative impacts to people and structures related to geologic and seismic hazards is more localized and site-specific than for many other environmental impacts. Impacts related to earthquakes and adverse soil conditions would be less than significant as a result of the required compliance with applicable building codes and geologic hazard regulations. Geologic/soil issues relate to local, site-specific soil conditions, ground response to earthquakes, and the potential for adverse soil conditions to damage the project's structural components. The only projects in the cumulative scenario that would contribute to or compound the identified impacts would be those that are overlapping or adjacent to the proposed project. Such projects would likewise be subject to the CBC and geologic hazard regulations, and would, thus, be designed and constructed to avoid substantial adverse impacts with respect to geology, soils, and seismic hazards. For this reason, cumulative impacts with respect to geologic and seismic hazards would be less than significant.

GHG Emissions

The cumulative nature of climate change and the project's potential to contribute to climate change impacts associated with project-generated GHG emissions is evaluated in Section 3.8. Per the SCAQMD guidance, construction emissions were estimated and amortized over the operational life of the project, which is assumed to be 30 years. This impact analysis, therefore, compares amortized construction emissions to the proposed SCAQMD threshold of 10,000 MT CO_2e per year. The estimated net increase in annual project-generated GHG emissions would be approximately 4 MT CO_2e per year as a result of project operation. When added to the amortized project construction emissions, the total annual net increase would be approximately 19 MT CO_2e per year. Annual operational GHG emissions with amortized construction emissions would be minimal and would not exceed the SCAQMD threshold of 10,000 MT CO_2e per year. The estimated average annual construction emissions would not exceed the recommended SCAQMD threshold of 10,000 MT CO_2e, the project would not result in cumulatively considerable emissions.

Hazards and Hazardous Materials

Cumulative impacts related to hazards and hazardous materials could result from projects that combine to increase exposure to hazards and hazardous materials. Development of the proposed project in combination with cumulative projects have the potential to increase to some degree the risks associated with the use and accidental release of hazardous materials. However, the proposed project would implement mitigation measures MM-HAZ-1 and MM-HAZ-2 to ensure that construction of the proposed project would not create a significant hazards to the public or the environment, and thus, would not cumulatively considerable. With respect to cumulative projects, the presence of hazardous substances would require evaluation on a case-by-case basis. Therefore, the proposed project, combined with the cumulative projects, would not result in a cumulatively considerable impact related to hazardous materials.

Hydrology and Water Quality

The geographic scope of cumulative effects on hydrology and water quality is the watershed affected by the proposed project. The potential impacts of the proposed project would relate to any alterations of water quality as a result of storm water discharge. Short-term construction impacts associated with the proposed project would comply with the City's Municipal Code to reduce runoff pollution. Similarly, cumulative projects would comply with existing regulations and short-term impacts would not be cumulatively considerable. Once operational, the project site would be restored to its preconstruction conditions and no loss of topsoil affecting downstream waterways would occur, no decrease in groundwater or interference in groundwater recharge would occur, and the proposed project would not involve the addition of impervious areas. Therefore, the proposed project's incremental contribution to a cumulative impact would not be considerable, and cumulative impacts on hydrology and water quality would be less than significant.

Land Use and Planning

The geographic scope of this analysis considers the City of Gardena, Los Angeles County, and other parcels owned and operated by the Districts. Similar to cumulative projects in these areas, the proposed project would not result in a conflict with an applicable land use plan, policy, or regulations. Cumulative projects would be evaluated on a case-by-case basis ensuring compatibility with the existing jurisdiction. Therefore, the proposed project's incremental contribution to a cumulative impact would not be considerable, and cumulative impacts on land use and planning would be less than significant.

Noise

Construction noise and vibration levels vary from hour to hour and day to day, depending on the equipment in use, the operations being performed, and the distance between the source and receptor. The highest noise levels predicted to occur at the nearest sensitive receptors during construction is 64 dBA for residences located approximately 320 feet to the west, and 61 dBA for the church located approximately 450 feet away to the southwest. Although nearby noise-sensitive land uses would be exposed to construction noise levels, the exposure would be relatively low compared to the existing ambient noise levels (ranging from 70.9 dBA to 80.9 dBA. While construction noise impacts would temporary elevate ambient noise levels, these events would be short-term and thus, cumulative impacts would be less than significant.

Upon completion, the proposed project would continue to operate as a pumping plant. Cumulative operational noise impacts could result from increased vehicle travel on local roadways, or on-site operational noises generated by the proposed project and cumulative projects. However, because the project would replace the existing facility with new, more efficient, quieter equipment and the equipment would be housed within a new structure designed to be at least as quiet as the existing structure, the noise level from the proposed project would not result in a substantial noise increase. Additionally, the proposed project would not generate any additional operational trips. Therefore, cumulative operational noise impacts would be less than significant.

Transportation

The geographic scope of the cumulative transportation impacts is the study area summarized in Section 3.17. The peak construction phase of the project is expected to generate approximately 40 daily

trips during the peak period of construction, with 14 AM peak-hour trips (12 inbound and 2 outbound), and 14 PM peak-hour trips (2 inbound and 12 outbound). With the application of passenger-car equivalence (PCE) factors to truck trips, the proposed project would generate 80 PCE daily trips, with 22 PCE trips during the AM peak hour (16 inbound and 6 outbound) and 22 PCE trips during the PM peak hour (6 inbound and 16 outbound). With the conservative PCE adjustment, the peak construction phase would generate less than 100 daily trips, and less than 25 peak-hour trips. When added to the street network, these trips would not have a measurable impact, and would not significantly impact any LOS thresholds in the cities of Torrance and Gardena. Additionally, because construction is temporary, all trips associated with project construction would cease after the completion of the pumping plant. Any trips associated with operational activities would be limited to scheduled maintenance and repair, similar to the existing condition, and would result in negligible (nominal) traffic to the study area. The proposed project does not generate the number of trips, which would require meeting the threshold for a traffic impact analysis for a CMP, and, thus, does not result in impacts to the Los Angeles County CMP.

During construction, lane closures, roadway closures, detours, driveway blockages, loss of parking, and disruptions to traffic, transit, bicycle, and pedestrian movement would occur around the project site. This may result in a potentially significant safety hazard to construction workers and/or the public; therefore, mitigation measure MM-TRAF-1 would be required to reduce potential impacts related to design features and emergency access. Therefore, the proposed project's impacts related to transportation would not be cumulatively considerable.

Utilities and Service Systems

The proposed project involves the replacement of the plant superstructure and pumps, the deep excavation of the dry/wet well, the improvement of force mains and cross connections, and upgrading associated equipment. The proposed project itself is a utility improvement project. The proposed project would not generate water supply demand or increase water flows, would not generate additional wastewater, and would not substantially change the amount of stormwater flowing on and off site. Additionally, because the proposed project would result in operations similar to those under existing conditions, impacts to electric power, natural, and telecommunication facilities would be less than significant. Construction activities of the proposed project involve demolition of asphalt and existing structures, grading, and excavation. The waste generated during construction would consist of asphalt pavement and other building and earthen materials. No long-term operational generation of solid waste would be associated with the proposed project.

In summary, the proposed project would not have impacts that are individually limited but cumulatively considerable. Impacts would be less than significant with the mitigation incorporated, as discussed above.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less-Than-Significant Impact with Mitigation Incorporated. As evaluated throughout this document, with incorporation of mitigation, environmental impacts associated with the proposed project would be reduced to less-than-significant levels. Thus, the proposed project would not directly or indirectly cause substantial adverse effects on human beings.

INTENTIONALLY LEFT BLANK.

4 Reponses to Comments

This section of the Final IS/MND includes all comments that were received during the 20-day public review period for the Draft IS/MND, along with responses to comments. The Draft IS/MND was made available for public comment for a 20-day public review period from April 30, 2019, through May 19, 2019. In accordance with the CEQA Guidelines, Section 15074(b) (14 CCR 15074(b)), before approving the proposed project, the District, as the lead agency under CEQA, will consider the MND with any comments received during this public review period. Specifically, Section 15074(b) of the CEQA Guidelines (14 CCR 15074(b)) states the following:

> Prior to approving a project, the decision-making body of the lead agency shall consider the proposed negative declaration or mitigated negative declaration together with any comments received during the public review process. The decision-making body shall adopt the proposed negative declaration or mitigated negative declaration only if it finds on the basis of the whole record before it (including the initial study and any comments received), that there is no substantial evidence that the project will have a significant effect on the environment and that the negative declaration or mitigated negative declaration reflects the lead agency's independent judgment and analysis.

During the public review period, the District received one written comment letter on the Draft IS/MND, which is listed in Table 16. The written comment received on the Draft IS/MND has been assigned an identification letter to facilitate identification and tracking.

Table 16. Comment Letter Summary

Comment Letter	Commenter	Date
A	Gabrieleño Band of Mission Indians – Kizh Nation	May 8, 2019

Although CEQA (California Public Resources Code, Section 21000 et seq.) and the CEQA Guidelines (14 CCR 15000 et seq.) do not explicitly require a lead agency to provide written responses to comments received on a proposed IS/MND, the lead agency may do so voluntarily. The following response was prepared to the one written comment received during the public review period.

Comment Letter A

GABRIELENO BAND OF MISSION INDIANS - KIZH NATION
Historically known as The San Gabriel Band of Mission Indians
recognized by the State of California as the aboriginal tribe of the Los Angeles basin

Notice of Intent to Adopt An Initial Study/ Mitigated Negative Declaration

May 8, 2019

Sanitation Districts of Los Angeles County

1955 Workman Mill Road

Whittier, CA 90601

Good Afternoon Debra Bogdanoff,

We have received your Notice of Intent to adopt a Negative Declaration for the Gardena Pumping Plant Upgrades in the location of the Los Angeles County. Our Tribal Government would like to be consulted if any ground disturbance will be conducted for this project.

A-1

Sincerely,
Gabrieleno Band of Mission Indians/Kizh Nation
(1844) 390-0787 Office

Andrew Salas, Chairman | Nadine Salas, Vice-Chairman | Dr. Christina Swindall Martinez, secretary
Albert Perez, treasurer I | Martha Gonzalez Lemos, treasurer II | Richard Gradias, Chairman of the council of Elders

PO Box 393 Covina, CA 91723 www.gabrielenoindians@yahoo.com gabrielenoindians@yahoo.com

4.1 Comment Letter A

Gabrieleño Band of Mission Indians – Kizh Nation

A-1 Thank you for your letter regarding the proposed Gardena Pumping Plant Upgrades (proposed project). The comment requests consultation related to ground-disturbing activities associated with the proposed project. The County Sanitation District No. 5 of Los Angeles County (District) conducted consultation on March 21, 2019. A subsequent call was held on May 7, 2019, with the Gabrieleño Band of Mission Indians – Kizh Nation to consider comments and concerns related to the proposed mitigation language for treatment of tribal cultural resources during ground-disturbing activities. As such, the language in mitigation measure (MM-) TRC-1 has been revised to specify the level of monitoring conducted by a qualified Native American monitor, provided by the Gabrieleño Band of Mission Indians – Kizh Nation, during ground-disturbing activities. The District now considers consultation under Assembly Bill 52 concluded.

INTENTIONALLY LEFT BLANK

5 Modifications to the Draft IS/MND

This section provides changes to the IS/MND presented in strikethrough text (i.e., ~~strikethrough~~) signifying deletions and underline (i.e., underline) signifying additions. These notations are meant to provide minor revisions resulting from public comments. None of the corrections or additions constitutes significant new information or substantial project changes requiring recirculation as defined by Section 15073.5 of the CEQA Guidelines.

Page 102, Section 3.18, Tribal Cultural Resources (a)(ii), MM-TRC-1

MM-TCR-1 To reduce potential impacts to unanticipated tribal cultural resources (TCRs) during project implementation, all construction personnel shall undergo Worker Environmental Awareness Program (WEAP) training to ensure that any unanticipated TCR discoveries are treated appropriately. The WEAP training shall provide specific details on the kinds of Native American cultural resources that may be identified during ground-disturbing activities.

Additionally, the County Sanitation District No. 5 of Los Angeles County (District), pursuant to Assembly Bill (AB) 52, has reviewed information provided through technical reports and consultations with California Native American tribes. Based on these discussions, the District shall invite the Gabrieleño Band of Mission Indians – Kizh Nation (Gabrieleño) to provide a qualified Native American monitor. The Native American monitor will be accompanied by an archaeological monitor retained by the District or the construction contractor. Monitors will be present part-time to observe initial disturbance of subsurface soils, and to continue to assess the site's potential to contain TCRs, as follows:

i) Soils beneath the paved parking and landscaped areas of the proposed project site will be monitored full-time to a maximum depth of 5 feet below the existing ground surface.

ii) If no TCRs have been identified within soils to this depth, monitoring will be reduced to no more than once a week, continuing at this frequency to a depth of 30 feet below the surface.

iii) District staff, based on ongoing review of observed subsurface conditions and information provided by Native American and archaeological monitors, may adjust monitoring strategies (increase, decrease, or discontinue), as appropriate.

iv) Should a potential TCR be inadvertently encountered, all construction work involving ground disturbance occurring within the vicinity of the find shall immediately stop and the District be notified. If the unanticipated resource is archaeological in nature, appropriate management requirements shall be implemented as outlined in MM-CUL-2 in conjunction with the following provisions specific to the management of TCRs. Depending on the nature of the find, if the District determines, pursuant to California Public Resources Code Section 21074 (a)(2), that the find appears to be a TCR in its discretion and is supported by substantial evidence, the affected tribe shall be provided a reasonable period of time to make recommendations. The District will review recommendations and move forward with management options determined to be reasonable and feasible. The project may resume ground-disturbing activities near the find after it has complied with these recommendations.

v) Native American and archaeological monitors shall document monitoring activities with daily logs and photograph disturbed soils to document compliance with MM-TCR-1 through 3. These logs, prepared by a qualified archaeologist, shall be appended to a monitoring summary letter report before being submitted to the District within 3 months of completion of monitoring.

6 Mitigation Monitoring and Reporting Program

6.1 Introduction

The California Environmental Quality Act (CEQA) requires that a public agency adopting a mitigated negative declaration (MND) take affirmative steps to determine that approved mitigation measures are implemented after project approval. The lead or responsible agency must adopt a reporting and monitoring program for the mitigation measures incorporated into a project or included as conditions of approval. The program must be designed to ensure compliance with the MND during project implementation (California Public Resources Code, Section 21081.6(a)(1)).

This Mitigation Monitoring and Reporting Program (MMRP) will be used by the County Sanitation District No. 5 of Los Angeles County (District) to ensure compliance with adopted mitigation measures identified in the MND for the proposed Gardena Pumping Plant Upgrades (proposed project). The District, as the lead agency, will be responsible for ensuring that all mitigation measures are carried out. Implementation of the mitigation measures would reduce impacts to below a level of significance for cultural resources, geology and soils, hazards and hazardous materials, transportation, and tribal cultural resources.

The remainder of this MMRP consists of a table that identifies the mitigation measures by resource for each project component. Table 17 identifies the mitigation monitoring and reporting requirements, including the party(ies) responsible for carrying out and verifying implementation of the mitigation measure and the timing of verification (prior to, during, or after construction). Space is provided for sign-off following completion/implementation of the mitigation measure. Along with the MND and related documents, this MMRP will be kept on file at the following location:

County Sanitation District of Los Angeles County
1955 Workman Mill Road
Whittier, California 9060

6.2 Mitigation Monitoring and Reporting Program Checklist

Table 17. Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Timing	Agency Responsible for Monitoring	Date of Completion
Cultural Resources			
MM-CUL-1 To reduce potential impacts to unanticipated cultural resources during project implementation, all construction personnel shall undergo Worker Environmental Awareness Program (WEAP) training to ensure that any unanticipated archaeological discoveries are treated appropriately. The WEAP training shall provide specific details on the kinds of archaeological materials that may be identified during project implementation.	During construction	County Sanitation District No. 5 of Los Angeles County	
MM-CUL-2 In the event that archaeological resources (sites, features, or artifacts) are exposed during construction activities for the proposed project, all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist who meets the Secretary of the Interior's Professional Qualification Standards can evaluate the significance of the find and determine whether or not additional study is warranted. Should it be required, temporary flagging may be installed around a resource to avoid any disturbances from construction equipment. Depending on the significance of the find under CEQA (14 California Code of Regulations section 15064.5(f); Public Resources Code section 21082), the archaeologist may record the find to appropriate standards (thereby addressing any data potential) and allow work to continue. If the archaeologist observes the discovery to be potentially significant under CEQA, additional treatment may be required.	During construction	County Sanitation District No. 5 of Los Angeles County	
Geology and Soils			
MM-GEO-1 Prior to the commencement of any grading activity, the applicant shall retain a qualified paleontologist, subject to the review and approval of the District to ensure the implementation of a paleontological monitoring program. The Society of Vertebrate Paleontology (SVP 2010) defines a qualified paleontologist as having: 1. A graduate degree in paleontology or geology, and/or a publication record in peer reviewed journals; and demonstrated competence in field techniques, preparation, identification, curation, and reporting in the state or geologic province in which the project occurs; an advanced degree is	Prior to and during construction	County Sanitation District No. 5 of Los Angeles County	

Table 17. Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Timing	Agency Responsible for Monitoring	Date of Completion
less important than demonstrated competence and regional experience; 2. At least 2 full years' professional experience as assistant to a project paleontologist with administration and project management experience; supported by a list of projects and referral contacts; 3. Proficiency in recognizing fossils in the field and determining significance; 4. Expertise in local geology, stratigraphy, and biostratigraphy; and 5. Experience collecting vertebrate fossils in the field. The qualified paleontologist shall attend any preconstruction meetings and manage the paleontological monitor(s) if he or she is not doing the monitoring. A paleontological monitor should be on site during all excavations below the depth of previously disturbed sediments. The Society of Vertebrate Paleontology (SVP 2010) defines a qualified paleontological monitor as having: 1. A Bachelor Science or Bachelor of Arts degree in geology or paleontology and 1 year's experience monitoring in the state or geologic province of the specific project; an associate degree and/or demonstrated experience showing ability to recognize fossils in a biostratigraphic context and recover vertebrate fossils in the field may be substituted for a degree; an undergraduate degree in geology or paleontology is preferable but is less important than documented experience performing paleontological monitoring; or 2. An Associate of Science or Associate of Arts in geology, paleontology, or biology and a demonstrated 2 years' experience collecting and salvaging fossil materials in the state or geologic province of the specific project; or 3. Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and 2 years' monitoring experience in the state or geologic province of the specific project; and 4. Monitors must demonstrate proficiency in recognizing various types of fossils, in collection methods, and in other paleontological field techniques." The paleontological monitor shall monitor construction excavations below a depth of 5 feet bgs in areas underlain by Quaternary alluvium and all excavations in areas underlain by elevated Quaternary alluvium as determined by the qualified paleontologist based on the construction plans. The paleontological monitor shall			

Table 17. Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Timing	Agency Responsible for Monitoring	Date of Completion
be equipped with necessary tools for the collection of fossils and associated geological and paleontological data. The monitor shall complete daily logs detailing the day's excavation activities and pertinent geological and paleontological data. In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor shall temporarily halt and/or divert grading activity to allow recovery of paleontological resources. The area of discovery shall be roped off with a 50-foot-radius buffer. Once documentation and collection of the find is completed, the monitor shall remove the rope and allow grading to recommence in the area of the find. Following the paleontological monitoring program, a final monitoring report shall be submitted to the District for approval. The report shall summarize the monitoring program and include geological observations and any paleontological resources recovered during paleontological monitoring for the proposed project.			
Hazards and Hazardous Materials			
MM-NOI-1 Hazardous Materials Management/Contingency Plan. Prior to construction, the District shall develop a hazardous materials management/contingency plan (HMMCP) that addresses the potential concern related to the anticipated locations of contaminated soils and groundwater, and anticipated contaminants. The HMMCP shall be followed during demolition, excavation, and construction activities for the proposed project. The HMMCP shall include training procedures for identification of contaminated soils and groundwater (if anticipated to be encountered) in the excavations. Contaminated soils and/or groundwater shall be managed and disposed of in accordance with local and state regulations. The HMMCP shall include health and safety measures including periodic work breathing zone monitoring and potential South Coast Air Quality Management District Rule 1166 monitoring for volatile organic compounds using a handheld organic vapor analyzer, in the event impacted soils are encountered during excavation activities. The District or its construction contractor shall implement the HMMCP during construction activities for the proposed project. If impacts are encountered in the excavation, the HMMCP shall contain procedures for evaluation of the impacts and notification, as necessary.	Pre-construction	County Sanitation District No. 5 of Los Angeles County	
MM-NOI-2 Prior to the demolition of on-site buildings, a lead-based paint and asbestos survey shall be conducted by a California Occupational Safety and Health Administration–certified asbestos consultant and/or certified site surveillance technician and a California Department of Public Health–certified lead	Prior to construction	County Sanitation District No. 5 of Los Angeles County	

Table 17. Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Timing	Agency Responsible for Monitoring	Date of Completion
inspector/risk assessor or sampling technician. These persons shall provide the Districts with a report documenting material types, conditions, and general quantities along with diagrams and photos of positive materials. Demolition or renovation plans and contract specifications must incorporate any abatement procedures for the removal of material containing asbestos or lead-based paint. All abatement work must be performed in accordance with all applicable federal, state, and local regulations.			
Transportation			
MM-TRA-1 Construction Traffic Management Plan. Prior to the start of any construction-related work or encroachment, the Districts shall develop and implement a Construction Traffic Management Plan. The Construction Traffic Management Plan shall include, but will not be limited to, the following measures: 1. All construction activities shall be conducted in accordance with the Greenbook, traffic control plans designed by the Cities of Torrance and/or Gardena, and the Work Area Traffic Control Handbook Manual (WATCH) to reduce any impacts to levels of service, traffic safety, and emergency access to the site during construction. 2. The Districts shall install temporary equipment and measures necessary for safe and efficient traffic control including changeable message signs, delineators, arrow boards, flagmen, etc. 3. The Districts shall provide advance notification of the proposed construction work area limits and lane closure times to transit services and all local emergency service providers (police, fire, ambulance, etc.). 4. Qualified flagmen shall be posted at each work site to direct construction traffic entering and exiting the site and/or to direct large construction-related vehicles to/from the work areas. 5. Two-way travel shall always be provided along Artesia Boulevard. During construction periods with reduced lane capacity, the Districts shall implement a Traffic Control Plan that includes detour routes around the impacted lane segments. 6. The Traffic Control Plans shall also include detours and safe passage areas for bicyclists and pedestrians in the impacted work areas.	Prior to construction	County Sanitation District No. 5 of Los Angeles County	

Table 17. Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Timing	Agency Responsible for Monitoring	Date of Completion
Tribal Cultural Resources			
MM-TRC-1 To reduce potential impacts to unanticipated tribal cultural resources (TCRs) during project implementation, all construction personnel shall undergo Worker Environmental Awareness Program (WEAP) training to ensure that any unanticipated TCR discoveries are treated appropriately. The WEAP training shall provide specific details on the kinds of Native American cultural resources that may be identified during ground-disturbing activities. Additionally, the County Sanitation District No. 5 of Los Angeles County (District), pursuant to Assembly Bill (AB) 52, has reviewed information provided through technical reports and consultations with California Native American tribes. Based on these discussions, the District shall invite the Gabrieleño Band of Mission Indians – Kizh Nation (Gabrieleño) to provide a qualified Native American monitor. The Native American monitor will be accompanied by an archaeological monitor retained by the District or the construction contractor. Monitors will be present part-time to observe initial disturbance of subsurface soils, and to continue to assess the site's potential to contain TCRs, as follows: i) Soils beneath the paved parking and landscaped areas of the proposed project site will be monitored full-time to a maximum depth of 5 feet below the existing ground surface. ii) If no TCRs have been identified within soils to this depth, monitoring will be reduced to no more than once a week, continuing at this frequency to a depth of 30 feet below the surface. iii) District staff, based on ongoing review of observed subsurface conditions and information provided by Native American and archaeological monitors, may adjust monitoring strategies (increase, decrease, or discontinue), as appropriate. iv) Should a potential TCR be inadvertently encountered, all construction work involving ground disturbance occurring within the vicinity of the find shall immediately stop and the District be notified. If the unanticipated resource is archaeological in nature, appropriate management requirements shall be implemented as outlined in MM-CUL-2 in conjunction with the following provisions specific to the management of TCRs. Depending on the nature of the find, if the District determines, pursuant to California Public Resources	Prior to and during construction	County Sanitation District No. 5 of Los Angeles County	

Table 17. Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Timing	Agency Responsible for Monitoring	Date of Completion
Code Section 21074 (a)(2), that the find appears to be a TCR in its discretion and is supported by substantial evidence, the affected tribe shall be provided a reasonable period of time to make recommendations. The District will review recommendations and move forward with management options determined to be reasonable and feasible. The project may resume ground-disturbing activities near the find after it has complied with these recommendations. v) Native American and archaeological monitors shall document monitoring activities with daily logs and photograph disturbed soils to document compliance with MM-TCR-1 through 3. These logs, prepared by a qualified archaeologist, shall be appended to a monitoring summary letter report before being submitted to the District within 3 months of completion of monitoring.			
MM-TRC-2 Although no tribal cultural resources (TCRs) have been identified that may be affected by the project, the following approach for the inadvertent discovery of TCRs has been prepared to ensure there are no impacts to unanticipated resources. Should a potential TCR be encountered during construction activities, all work in the immediate vicinity of the discovery (within 50 feet) shall cease, the Districts shall be notified, and a qualified archaeologist meeting Secretary of Interior standards shall assess the find. The Districts shall notify Native American tribes consulting under Assembly Bill (AB) 52. If the potential resource is archaeological in nature, appropriate management requirements shall be implemented, as outlined in Mitigation Measure **MM-TCR-1**. If the Districts determines that the potential resource is a TCR (as defined by PRC, Section 21074), tribes consulting under AB 52 shall be provided a reasonable period of time, typically 5 days from the date that a new discovery is made, to conduct a site visit and make recommendations regarding future ground disturbance activities and the treatment and disposition of any discovered TCRs. Depending on the nature of the resource and tribal recommendations, review by a qualified archaeologist may be required. Implementation of proposed recommendations shall be made based on the determination of the Districts that the approach is reasonable and feasible. Work on the other areas of the project site outside of the buffered area may continue during this assessment period. All activities shall be conducted in accordance with regulatory requirements.	During construction	County Sanitation District No. 5 of Los Angeles County	

Table 17. Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Timing	Agency Responsible for Monitoring	Date of Completion
MM-TRC-3 If significant Native American cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, a qualified archaeologist shall be retained to develop a Cultural Resources Treatment Plan, the drafts of which shall be provided to the interested tribe(s) for review and comment. (1) All in-field investigations, assessments, and/or data recovery enacted pursuant to the finalized Treatment Plan shall be monitored by a Native American monitor. (2) The Districts shall, in good faith, consult with the interested tribe(s) on the disposition and treatment of any artifacts or other cultural materials encountered during the project	During construction	County Sanitation District No. 5 of Los Angeles County

Appendix A

Air Quality and Greenhouse Gas Emissions

Gardena Pumping Plant - Project
Los Angeles-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	0.60	1000sqft	0.01	600.00	0
Parking Lot	10.00	1000sqft	0.23	10,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2024
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	601.59	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted CO2 Intensity Factor based on SCE's 2017 Power Content Label

Land Use - 600 square foot proposed pump plant and 10 ksf area to be paved

Construction Phase - Construction schedule based on LACSD input

Off-road Equipment - Added a trencher to Grading phase for infrastructure

Trips and VMT - Default on-road vehicles, rounded up to even numbers

Demolition - Debris tonnage based on CalEEMod factor of 0.046 tons/sf for buildings and CalRecycle factor of 2,400 lbs asphalt debris/yd3

Grading - 10,000 CY soil export, total acreage graded based on rubber tired dozer of 0.5 acre/8-hour day per SCAQMD

Architectural Coating - Default architectural coatings

Vehicle Trips - One Pumping Plant Operator per day

Consumer Products - Default

Area Coating - Default

Energy Use - Adjusted electricity to match values provided by LACSD

Water And Wastewater - Adjusted to match values provided by LACSD

Solid Waste - Adjusted to match values provided by LACSD

Construction Off-road Equipment Mitigation - Water exposed areas 3x/day, limit vehicle speeds to 15 mph

Stationary Sources - Emergency Generators and Fire Pumps - Proposed 350 kW emergency generator - 1 hour testing per day per month; up to 50 hours per year per ATCM

Stationary Sources - Emergency Generators and Fire Pumps EF - Default emission rates for the proposed Tier 3 generator

Gardena Pumping Plant - Project
Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	0.60	1000sqft	0.01	600.00	0
Parking Lot	10.00	1000sqft	0.23	10,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2024
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	601.59	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted CO2 Intensity Factor based on SCE's 2017 Power Content Label

Land Use - 600 square foot proposed pump plant and 10 ksf area to be paved

Construction Phase - Construction schedule based on LACSD input

Off-road Equipment - Added a trencher to Grading phase for infrastructure

Trips and VMT - Default on-road vehicles, rounded up to even numbers

Demolition - Debris tonnage based on CalEEMod factor of 0.046 tons/sf for buildings and CalRecycle factor of 2,400 lbs asphalt debris/yd3

Grading - 10,000 CY soil export, total acreage graded based on rubber tired dozer of 0.5 acre/8-hour day per SCAQMD

Architectural Coating - Default architectural coatings

Vehicle Trips - One Pumping Plant Operator per day

Consumer Products - Default

Area Coating - Default

Energy Use - Adjusted electricity to match values provided by LACSD

Water And Wastewater - Adjusted to match values provided by LACSD

Solid Waste - Adjusted to match values provided by LACSD

Construction Off-road Equipment Mitigation - Water exposed areas 3x/day, limit vehicle speeds to 15 mph

Stationary Sources - Emergency Generators and Fire Pumps - Proposed 350 kW emergency generator - 1 hour testing per day per month; up to 50 hours per year per ATCM

Stationary Sources - Emergency Generators and Fire Pumps EF - Default emission rates for the proposed Tier 3 generator

11.0 Vegetation

Gardena Pumping Plant - Project
Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	0.60	1000sqft	0.01	600.00	0
Parking Lot	10.00	1000sqft	0.23	10,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2024
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	601.59	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted CO2 Intensity Factor based on SCE's 2017 Power Content Label

Land Use - 600 square foot proposed pump plant and 10 ksf area to be paved

Construction Phase - Construction schedule based on LACSD input

Off-road Equipment - Added a trencher to Grading phase for infrastructure

Trips and VMT - Default on-road vehicles, rounded up to even numbers

Demolition - Debris tonnage based on CalEEMod factor of 0.046 tons/sf for buildings and CalRecycle factor of 2,400 lbs asphalt debris/yd3

Grading - 10,000 CY soil export, total acreage graded based on rubber tired dozer of 0.5 acre/8-hour day per SCAQMD

Architectural Coating - Default architectural coatings

Vehicle Trips - One Pumping Plant Operator per day

Consumer Products - Default

Area Coating - Default

Energy Use - Adjusted electricity to match values provided by LACSD

Water And Wastewater - Adjusted to match values provided by LACSD

Solid Waste - Adjusted to match values provided by LACSD

Construction Off-road Equipment Mitigation - Water exposed areas 3x/day, limit vehicle speeds to 15 mph

Stationary Sources - Emergency Generators and Fire Pumps - Proposed 350 kW emergency generator - 1 hour testing per day per month; up to 50 hours per year per ATCM

Stationary Sources - Emergency Generators and Fire Pumps EF - Default emission rates for the proposed Tier 3 generator

Gardena Pumping Plant - Existing
Los Angeles-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	0.89	1000sqft	0.02	885.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2019
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	601.59	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted CO2 Intensity Factor based on SCE's 2017 Power Content Label

Land Use - 885 square foot existing pump plant

Construction Phase - Modeling operations only

Vehicle Trips - One Pumping Plant Operator per day

Consumer Products - Default

Area Coating - Default

Energy Use - Adjusted electricity to match values provided by LACSD

Water And Wastewater - Adjusted to match values provided by LACSD

Solid Waste - Adjusted to match values provided by LACSD

Stationary Sources - Emergency Generators and Fire Pumps - Existing 150 kW emergency generator - 1 hour testing per day per month; up to 50 hours per year per ATCM

Stationary Sources - Emergency Generators and Fire Pumps EF - Adjusted emission rates based on age of existing generator (1988) assuming Tier 1

Gardena Pumping Plant - Existing

Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	0.89	1000sqft	0.02	885.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2019
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	601.59	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted CO2 Intensity Factor based on SCE's 2017 Power Content Label

Land Use - 885 square foot existing pump plant

Construction Phase - Modeling operations only

Vehicle Trips - One Pumping Plant Operator per day

Consumer Products - Default

Area Coating - Default

Energy Use - Adjusted electricity to match values provided by LACSD

Water And Wastewater - Adjusted to match values provided by LACSD

Solid Waste - Adjusted to match values provided by LACSD

Stationary Sources - Emergency Generators and Fire Pumps - Existing 150 kW emergency generator - 1 hour testing per day per month; up to 50 hours per year per ATCM

Stationary Sources - Emergency Generators and Fire Pumps EF - Adjusted emission rates based on age of existing generator (1988) assuming Tier 1

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2019
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	601.59	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted CO2 Intensity Factor based on SCE's 2017 Power Content Label

Land Use - 885 square foot existing pump plant

Construction Phase - Modeling operations only

Vehicle Trips - One Pumping Plant Operator per day

Consumer Products - Default

Area Coating - Default

Energy Use - Adjusted electricity to match values provided by LACSD

Water And Wastewater - Adjusted to match values provided by LACSD

Solid Waste - Adjusted to match values provided by LACSD

Stationary Sources - Emergency Generators and Fire Pumps - Existing 150 kW emergency generator - 1 hour testing per day per month; up to 50 hours per year per ATCM

Stationary Sources - Emergency Generators and Fire Pumps EF - Adjusted emission rates based on age of existing generator (1988) assuming Tier 1

EXECUTIVE SUMMARY

Dudek has been retained by the Sanitation Districts of Los Angeles County (LACSD) in support of the proposed upgrades to the existing Gardena Pumping Plant at 1919 West Artesia Boulevard in the City of Gardena, Los Angeles County, California. The proposed Gardena Pumping Plant Upgrades (project) would include the replacement of the existing plant superstructure and the existing pumps, deep excavation of a dry/wet well, improvement of force mains and cross connections, and associated equipment upgrades within the pump station. The project area is located at 1919, 1923, and 1931 West Artesia Boulevard.

The cultural resources technical report involved completion of a California Historical Resources Information System (CHRIS) records search, outreach with the Native American Heritage Commission (NAHC) and local Native American individuals and/or tribal organizations, a pedestrian survey of the project area for built environment resources, and recordation and evaluation of three built environment resources for historical significance. The significance evaluation included conducting archival and building development research for each building on the project site, outreach at local libraries, and completion of a historic context. This study was conducted in accordance with California Environmental Quality Act (CEQA) Guidelines Section 15064.5(a)(2)–(3), and the project site was evaluated in consideration of National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) eligibility and integrity requirements.

No archaeological resources were identified within the project site as a result of the CHRIS records search or Native American coordination. No specific archaeological resources or sensitivity concerns were identified by any sources consulted. However, it is always possible that intact archaeological deposits are present at subsurface levels. For this reason, the project site should be treated as potentially sensitive for archaeological resources. Management recommendations to reduce potential impacts to unanticipated archaeological resources and human remains during construction activities are provided in Section 6.2, Management Recommendations.

Three properties (Gardena Pumping Plant, 1923 West Artesia Boulevard, and 1931 West Artesia Boulevard) were evaluated for historical significance and do not appear eligible for inclusion in the NRHP or CRHR (6Z) due to a lack of significant historical associations. These properties are not considered historical resources for the purposes CEQA. Therefore, the proposed project would have a less-than-significant impact on historical resources for the purposes of CEQA.

INTENTIONALLY LEFT BLANK

1 INTRODUCTION

Dudek was retained by the Sanitation Districts of Los Angeles County (LACSD) to complete a cultural resources technical report for a project that proposes to upgrade the existing pump station along Artesia Boulevard in the City of Gardena, Los Angeles County, California (project) (Figure 1, Regional Map). This Cultural Resources Technical Report provides the results of a California Historical Resources Information System (CHRIS) records search, discusses Assembly Bill (AB) 52 and Native American Heritage Commission (NAHC) consultation assistance, discusses the pedestrian survey of all historic-age buildings and structures within the project site and any buildings that may be indirectly impacted by the proposed project, and records and evaluates built environment resources for historical significance. The significance evaluation included conducting archival and building development research; outreach with local libraries, historical societies, and advocacy groups; and completion of a historic context. This study was conducted in accordance with CEQA Guidelines Section 15064.5(a)(2)–(3), and the project site was evaluated in consideration of National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) eligibility and integrity requirements.

1.1 Project Description

The proposed project would address the existing safety, reliability, and maintenance issues of the existing Gardena Pumping Plant by consolidating the East and West Plants into one new pumping plant near the existing location. The proposed project would include the following components:

- Replacement of plant superstructure
- Replacements of pumps
- Deep excavation of dry/wet well
- Improvement of force mains and cross connections
- Associated equipment upgrades

The proposed project would serve the same function as the existing Gardena Pumping Plant, and would continue to accept wastewater flows from the 36-inch-diameter Gramercy Place Trunk Section 1 Sewer, the 24-inch-diameter Moneta Extension Trunk Sewer, and the 24-inch-diameter Gardena Pump Trunk Sewer. The influent would be directed to one new wet well via improved cross connections. The flow capacities of the upgraded Gardena Pumping Plant would be the same as current combined flows for the East and West Plants. Effluent would be directed back to LACSD's wastewater collection system via improved force mains. In addition, operation and maintenance activities would be the same as the existing conditions. The proposed project would be designed for uninterruptible operation through features such as redundant pumps, redundant force mains, and backup generators. The new pumping plant superstructure would be approximately 576 square feet and 13 feet high.

1.2 Project Location

The project location, also called the Gardena Pumping Plant, is at 1919 West Artesia Boulevard (Assessor's Parcel Number [APN] 4094-007-903), located on the north side of West Artesia Boulevard (State Route 91), bordered by open-air parking and the Dominguez Channel to the east, and mixed-use commercial/industrial buildings to the west and north. The LACSD project parcel is 0.086 acres and generally located between West Artesia Boulevard, Gramercy Place, West 169th Street, and South Western Avenue in the southwestern section of the City of Gardena. The project site contains a single brick building built in 1928 with a 1960 addition. The building houses a pumping station for LACSD's District No. 5, which serves 87.5 square miles. The project also includes two commercial businesses on adjacent parcels 1923 West Artesia Boulevard (APN 4094-007-005), and 1931 West Artesia Boulevard (APN 4094-007-004) (Figure 2, Project Location Map).

The Gardena Pumping Plant, and adjacent properties are located in the southern portion of the City of Gardena, adjacent to the City of Torrance. The project site is in the South Bay region of Los Angeles County, between the Cities of Torrance and Carson. Generally, the project site is located northwest of the Interstate 405 and State Route 110 intersection and west of the Dominguez Channel. Specifically, the project site is located at 1919 West Artesia Boulevard in the City of Gardena.

1.3 Project Personnel

Dudek staff completed all cultural resources technical work in support of this report. Dudek Architectural Historian Kate Kaiser, MSHP, and Dudek Archaeologists Linda Kry, BA, and Erica Nicolay, MA, authored this report. Ms. Kaiser also prepared the archival research, the Department of Parks and Recreation (DPR) forms, and the significance evaluation. Ms. Kry and Ms. Nicolay contributed to archaeological components of this report, including review and summary of CHRIS records search results. This report was reviewed for quality assurance/quality control by Principal Architectural Historian and Archaeologist Samantha Murray, MA, RPA. All project staff meet or exceed the Secretary of the Interior's Professional Qualification Standards (36 Code of Federal Regulations [CFR] Part 61) in architectural history or archaeology. Preparers' qualifications can be reviewed in Appendix A.

1.4 Regulatory Setting

This section includes a discussion of the applicable state and local laws, ordinances, regulations, and standards governing cultural resources, which must be adhered to before and during construction of the proposed project.

Federal

Although there is no federal nexus for this project, resources were evaluated in consideration of NRHP designation criteria.

The NRHP is the United States' official list of districts, sites, buildings, structures, and objects worthy of preservation. Overseen by the National Park Service under the U.S. Department of the Interior, the NRHP was authorized under the National Historic Preservation Act, as amended. Its listings encompass all National Historic Landmarks and historic areas administered by the National Park Service.

NRHP guidelines for the evaluation of historic significance were developed to be flexible and to recognize the accomplishments of all who have made significant contributions to the nation's history and heritage. Its criteria are designed to guide state and local governments, federal agencies, and others in evaluating potential entries in the NRHP. For a property to be listed in or determined eligible for listing, it must be demonstrated to possess integrity and to meet at least one of the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.

Integrity is defined in NRHP guidance, How to Apply the National Register Criteria, as "the ability of a property to convey its significance. To be listed in the NRHP, a property must not only be shown to be significant under the NRHP criteria, but it also must have integrity" (Andrus and Shrimpton 2002). Historic properties either retain integrity (convey their significance) or they do not. Within the concept of integrity, the National Register criteria recognizes seven aspects or qualities that define integrity. The seven aspects of integrity are locations, setting, design, materials, workmanship, feeling and association. In order to retain historic integrity "a property will always possess several, and usually most, of the aspects" (Andrus and Shrimpton 2002).

NRHP guidance further asserts that properties be completed at least 50 years ago to be considered for eligibility. Properties completed fewer than 50 years before evaluation must be proven to be "exceptionally important" (criteria consideration G) to be considered for listing.

A historic property is defined as "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the NRHP maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the NRHP criteria" (36 CFR Section 800.16(i)(1)).

Effects on historic properties under National Historic Preservation Act Section 106 are defined in the assessment of adverse effects in 36 CFR Section 800.5(a)(1).

State

California Register of Historical Resources (California Public Resources Code Sections 5020 et seq.)

In California, the term "historical resource" includes "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code [PRC] Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1(a)). The criteria for listing resources in the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated below. According to PRC Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

(2) Is associated with the lives of persons important in our past;

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

(4) Has yielded, or may be likely to yield, information important in prehistory or history.

To understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 California Code of Regulations Section 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed in or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

CEQA

As described further, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- PRC Section 21083.2(g) defines "unique archaeological resource."
- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource"; it also defines the circumstances when a project would materially impair the significance of an historical resource.
- PRC Section 21074(a) defines "tribal cultural resources."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant impact on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; CEQA Guidelines Section 15064.5(b)). If a site is either listed in or eligible for listing in the CRHR, included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for the purposes of CEQA (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource"—indicating a significant effect under CEQA—means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of a historical

resource is materially impaired when a project does any of the following (CEQA Guidelines Section 15064.5(b)(2)):

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to PRC Section 5020.1(k) or its identification in an historical resources survey meeting the requirements of PRC Section 5024.1(g), unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project would cause a substantial adverse change in the significance of an historical resource such that the resource's historical significance would be materially impaired.

If it can be demonstrated that a project would cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a), (b), and (c)).

PRC Section 21083.2(g) defines a unique "archaeological resource" as an "archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type; or
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person."

Impacts to non-unique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as a tribal cultural resource (PRC Sections 21074(c), 21083.2(h)); further consideration of significant impacts is required.

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. These procedures, described as follows, are detailed in PRC Section 5097.98.

California Health and Safety Code

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains can occur until the County Coroner has examined the remains (Health and Safety Code Section 7050.5b). PRC Section 5097.98 outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Health and Safety Code Section 7050.5c). The NAHC would notify the most likely descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

Local

The City of Gardena does not have an historic preservation ordinance or specific policies related to cultural resources. However, the 2006 Gardena General Plan includes a brief list of goals for management of cultural resources (City of Gardena 2006):

Gardena General Plan 2006 – Conservation Plan

CN Goal 5 Protect the City's cultural resources.

CN 5.1: Maintain an inventory of the City's historical resources, including a survey of buildings of architectural, cultural or historical significance.

CN 5.2: Provide provisions in the Municipal Code to protect historical and cultural resources.

CN 5.3: Protect and preserve cultural resources of the Gabrielino Native American Tribe found or uncovered during construction.

INTENTIONALLY LEFT BLANK

2 HISTORIC CONTEXT

2.1 Prehistoric Overview

Evidence for continuous human occupation in Southern California spans the last 10,000 years. Various attempts to parse out variability in archaeological assemblages over this broad period have led to the development of several cultural chronologies; some of these are based on geologic time, most are based on temporal trends in archaeological assemblages, and others are interpretive reconstructions. To be more inclusive, this research employs a common set of generalized terms used to describe chronological trends in assemblage composition: Paleoindian (pre-5500 BC), Archaic (8000 BC–AD 500), Late Prehistoric (AD 500–1769), and Ethnohistoric (post-AD 1769).

Paleoindian Period (pre-5500 BC)

Evidence for Paleoindian occupation in the region is tenuous. Our knowledge of associated cultural pattern(s) is informed by a relatively sparse body of data that has been collected from within an area extending from coastal San Diego, through the Mojave Desert, and beyond. One of the earliest dated archaeological assemblages in the region is located in coastal Southern California (though contemporaneous sites are present in the Channel Islands) derives from SDI-4669/W-12 in La Jolla. A human burial from SDI-4669 was radiocarbon dated to 9,590–9,920 years before present (95.4% probability) (Hector 1985). The burial is part of a larger site complex that contained more than 29 human burials associated with an assemblage that fits the Archaic profile (i.e., large amounts of ground stone, battered cobbles, and expedient flake tools). In contrast, typical Paleoindian assemblages include large stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of ground stone tools. Prime examples of this pattern are sites that were studied by Emma Lou Davis (1978) on Naval Air Weapons Station China Lake near Ridgecrest, California. These sites contained fluted and unfluted stemmed points and large numbers of formal flake tools (e.g., shaped scrapers, blades). Other typical Paleoindian sites include the Komodo site (MNO-679)—a multi-component fluted point site, and MNO-680—a single component Great Basined Stemmed point site (see Basgall et al. 2002). At MNO-679 and -680, groundstone tools were rare but finely made projectile points were common.

Warren et al. (2004) claimed that a biface (prehistoric stone tool that has been flaked on both faces), manufacturing tradition present at the Harris site complex (SDI-149) is representative of typical Paleoindian occupation in the region that possibly dates between 10,365 and 8,200 BC (Warren et al. 2004). Termed San Dieguito (see also Rogers 1945), assemblages at the Harris site are qualitatively distinct from most others in region because the site has large numbers of finely made bifaces (including projectile points), formal flake tools, a biface reduction trajectory, and relatively small amounts of processing tools (see also Warren 1968). Despite the unique assemblage composition, the definition of San Dieguito as a separate cultural tradition is hotly debated. Gallegos (1987) suggested that the San Dieguito pattern is simply an inland manifestation of a

broader economic pattern. Gallegos's interpretation of San Dieguito has been widely accepted in recent years, in part because of the difficulty in distinguishing San Dieguito components from other assemblage constituents. In other words, it is easier to ignore San Dieguito as a distinct socioeconomic pattern than it is to draw it out of mixed assemblages.

The large number of finished bifaces (i.e., projectile points and non-projectile blades), along with large numbers of formal flake tools at the Harris site complex, is very different than nearly all other assemblages throughout the region, regardless of age. Warren et al. (2004) made this point, tabulating basic assemblage constituents for key early Holocene sites. Producing finely made bifaces and formal flake tools implies that relatively large amounts of time were spent for tool manufacture. Such a strategy contrasts with the expedient flake-based tools and cobble-core reduction strategy that typifies non-San Dieguito Archaic sites. It can be inferred from the uniquely high degree of San Dieguito assemblage formality that the Harris site complex represents a distinct economic strategy from non-San Dieguito assemblages.

San Dieguito sites are rare in the inland valleys, with one possible candidate, RIV-2798/H, located on the shore of Lake Elsinore. Excavations at Locus B at RIV-2798/H produced a toolkit consisting predominately of flaked stone tools, including crescents, points, and bifaces, and lesser amounts of groundstone tools, among other items (Grenda 1997). A calibrated and reservoir-corrected radiocarbon date from a shell produced a date of 6630 BC. Grenda (1997) suggested this site represents seasonal exploitation of lacustrine resources and small game and resembles coastal San Dieguito assemblages and spatial patterning.

If San Dieguito truly represents a distinct socioeconomic strategy from the non-San Dieguito Archaic processing regime, its rarity implies that it was not only short-lived, but that it was not as economically successful as the Archaic strategy. Such a conclusion would fit with other trends in Southern California deserts, where hunting-related tools were replaced by processing tools during the early Holocene (see Basgall and Hall 1990).

Archaic Period (8000 BC – AD 500)

The more than 2,500-year overlap between the presumed age of Paleoindian occupations and the Archaic period highlights the difficulty in defining a cultural chronology in Southern California. If San Dieguito is the only recognized Paleoindian component in the coastal Southern California, then the dominance of hunting tools implies that it derives from Great Basin adaptive strategies and is not necessarily a local adaptation. Warren et al. (2004) admitted as much, citing strong desert connections with San Dieguito. Thus, the Archaic pattern is the earliest local socioeconomic adaptation in the region (see Hale 2001, 2009).

The Archaic pattern, which has also been termed the Millingstone Horizon (among others), is relatively easy to define with assemblages that consist primarily of processing tools, such as millingstones, handstones, battered cobbles, heavy crude scrapers, incipient flake-based tools, and cobble-core reduction. These assemblages occur in all environments across the region with little variability in tool composition. Low assemblage variability over time and space among Archaic sites has been equated with cultural conservatism (see Basgall and Hall 1990; Byrd and Reddy 2002; Warren 1968; Warren et al. 2004). Despite enormous

amounts of archaeological work at Archaic sites, little change in assemblage composition occurred until the bow and arrow was adopted around AD 500, and ceramics were adopted at approximately the same time (Griset 1996; Hale 2009). Even then, assemblage formality remained low. After the bow was adopted, small arrow points appear in large quantities and already low amounts of formal flake tools are replaced by increasing amounts of expedient flake tools. Similarly, shaped millingstones and handstones decreased in proportion relative to expedient, unshaped ground stone tools (Hale 2009). Thus, the terminus of the Archaic period is equally as hard to define as its beginning because basic assemblage constituents and patterns of manufacturing investment remain stable, complemented only by the addition of the bow and ceramics.

Late Prehistoric Period (AD 500–1769)

The period of time following the Archaic and before Ethnohistoric times (AD 1769) is commonly referred to as the Late Prehistoric (Rogers 1945; Wallace 1955; Warren et al. 2004); however, several other subdivisions continue to be used to describe various shifts in assemblage composition. In general, this period is defined by the addition of arrow points and ceramics, and the widespread use of bedrock mortars. The fundamental Late Prehistoric assemblage is very similar to the Archaic pattern, but includes arrow points and large quantities of fine debitage from producing arrow points, ceramics, and cremations. The appearance of mortars and pestles is difficult to place in time because most mortars are on bedrock surfaces. Some argue that the Ethnohistoric intensive acorn economy extends as far back as AD 500 (Bean and Shipek 1978). However, there is no substantial evidence that reliance on acorns, and the accompanying use of mortars and pestles, occurred before AD 1400. Millingstones and handstones persisted in higher frequencies than mortars and pestles until the last 500 years (Basgall and Hall 1990); even then, weighing the economic significance of millingstone-handstone versus mortar-pestle technology is tenuous due to incomplete information on archaeological assemblages.

2.2 Ethnographic Overview

The history of the Native American communities prior to the mid-1700s has largely been reconstructed through later mission-period and early ethnographic accounts. The first records of the Native American inhabitants of the region come predominantly from European merchants, missionaries, military personnel, and explorers. These brief, and generally peripheral, accounts were prepared with the intent of furthering respective colonial and economic aims and were combined with observations of the landscape. They were not intended to be unbiased accounts regarding the cultural structures and community practices of the newly encountered cultural groups. The establishment of the missions in the region brought more extensive documentation of Native American communities, although these groups did not become the focus of formal and in-depth ethnographic study until the early twentieth century (Bean and Shipek 1978; Boscana 1846; Geiger and Meighan 1976; Harrington 1934; Laylander 2000; Sparkman 1908; White 1963). The principal intent of these researchers was to record the precontact, culturally specific practices, ideologies, and languages that had survived the destabilizing effects of missionization and colonialism. This research, often understood as "salvage ethnography," was driven by the understanding that traditional knowledge was being lost due to the impacts of modernization and cultural assimilation. Alfred Kroeber applied his "memory culture"

approach (Lightfoot 2005: 32) by recording languages and oral histories within the region. Ethnographic research by Dubois, Kroeber, Harrington, Spier, and others during the early twentieth century seemed to indicate that traditional cultural practices and beliefs survived among local Native American communities.

Even though there were many informants for these early ethnographies who were able to provide information from personal experiences about native life before the Europeans, a significantly large proportion of these informants were born after 1850 (Heizer and Nissen 1973); therefore, the documentation of pre-contact, aboriginal culture was being increasingly supplied by individuals born in California after considerable contact with Europeans. As Robert F. Heizer (1978) stated, this is an important issue to note when examining these ethnographies, since considerable culture change had undoubtedly occurred by 1850 among the Native American survivors of California. This is also a particularly important consideration for studies focused on TCRs; where concepts of "cultural resource" and the importance of traditional cultural places are intended to be interpreted based on the values expressed by present-day Native American representatives and may vary from archaeological values (Giacinto 2012).

Based on ethnographic information, it is believed that at least 88 different languages were spoken from Baja California Sur to the southern Oregon state border at the time of Spanish contact (Johnson and Lorenz 2006: 34). The distribution of recorded Native American languages has been dispersed as a geographic mosaic across California through six primary language families (Golla 2007).

Victor Golla has contended that one can interpret the amount of variability within specific language groups as being associated with the relative "time depth" of the speaking populations (Golla 2007: 80) A large amount of variation within the language of a group represents a greater time depth then a group's language with less internal diversity. One method that he has employed is by drawing comparisons with historically documented changes in Germanic and Romantic language groups. Golla (2007: 71) has observed that the "absolute chronology of the internal diversification within a language family" can be correlated with archaeological dates. This type of interpretation is modeled on concepts of genetic drift and gene flows that are associated with migration and population isolation in the biological sciences.

The tribes of this area have traditionally spoken Takic languages that may be assigned to the larger Uto–Aztecan family (Golla 2007: 74). These groups include the Gabrielino, Cahuilla, and Serrano. Golla has interpreted the amount of internal diversity within these language-speaking communities to reflect a time depth of approximately 2,000 years. Other researchers have contended that Takic may have diverged from Uto–Aztecan ca. 2600 BC–AD 1, which was later followed by the diversification within the Takic speaking tribes, occurring approximately 1500 BC–AD 1000 (Laylander 2000).

Gabrielino/Tongva

The archaeological record indicates that the Gabrielino arrived in the Los Angeles Basin around 500 BC Many contemporary Gabrielino identify themselves as descendants of the indigenous people living across the plains of the Los Angeles Basin and adjacent areas and use the native term Tongva to describe themselves (King

1994). This term is used in the remainder of this section to refer to the pre-contact inhabitants of the Los Angeles Basin and their descendants. Surrounding native groups included the Chumash and Tataviam to the northwest, the Serrano and Cahuilla to the northeast, and the Juaneño and Luiseño to the southeast.

The name "Gabrielino" denotes those people who were administered by the Spanish from the San Gabriel Mission, which included people from the Gabrielino area proper as well as other social groups (Bean and Smith 1978; Kroeber 1925). Therefore, in the post-contact period, the name does not necessarily identify a specific ethnic or tribal group. The names by which Native Americans in the area that is now Southern California identified themselves have, for the most part, been lost. Many modern Gabrielino identify themselves as descendants of the indigenous people living across the plains of the Los Angeles Basin and refer to themselves as the Tongva (King 1994). This term is used in the remainder of this section to refer to the pre-Contact inhabitants of the Los Angeles Basin and their descendants.

Tongva lands encompassed the greater Los Angeles Basin and three Channel Islands: San Clemente, San Nicolas, and Santa Catalina. The Tongva established large, permanent villages in the fertile lowlands along rivers and streams, and in sheltered areas along the coast, stretching from the foothills of the San Gabriel Mountains to the Pacific Ocean. A total tribal population has been estimated of at least 5,000 (Bean and Smith 1978), but recent ethnohistoric work suggests a number approaching 10,000 (O'Neil 2002). Houses constructed by the Tongva were large, circular, domed structures made of willow poles thatched with tule that could hold up to 50 people (Bean and Smith 1978). Other structures served as sweathouses, menstrual huts, ceremonial enclosures, and probably communal granaries. Cleared fields for races and games, such as lacrosse and pole throwing, were created adjacent to Tongva villages (McCawley 1996). Archaeological sites composed of villages with various sized structures have been identified.

The largest, and best documented, ethnographic Tongva village in the vicinity was that of *Yanga* (also known as Yaangna, Janga, and Yabit), which was in the vicinity of the downtown Los Angeles, approximately 13 miles northeast of the project site (McCawley 1996:56-57; NEA and King 2004). This village was reportedly first encountered by the Portola expedition in 1769. In 1771, Mission San Gabriel was established. Yanga provided a large number of the recruitments to this mission; however, following the founding of the Pueblo of Los Angeles in 1781, opportunities for local paid work became increasingly common, which had the result of reducing the number of Native American neophytes from the immediately surrounding area (NEA and King 2004). Mission records indicate that 179 Gabrieleno inhabitants of Yanga were recruited to San Gabriel Mission (NEA and King 2004: 104). Based on this information, Yanga may have been the most populated village in the Western Gabrieleno territory.

Another Tongva village documented through archaeological and ethnographic evidence was located near the Ballona wetlands, approximately 10 miles northwest of the project site. This was the village of *Guaspet*, also called *Guaucha* in historical documents (Altschul et al. 2003: 24). The exact location of the village is uncertain but recent archaeological and ethnographic research suggests that it was located in the Ballona Wetland (Altschul et al. 2003: 24). References to Guaspet in baptismal records have indicated that as many as 115

individuals from that village were baptized at Mission San Gabriel between 1788 and 1819. This indicates that the village existed throughout the Mission period and into the Rancho period, which is further supported by evidence of interactions between Tongva and Spanish ranchers associated with Rancho Los Quintos, in the Ballona (Stoll et al. 2009). Evidence supports the idea that the village of Guaspet was abandoned by 1820, as the native way of life and the native habitat was likely adversely affected by ranching in the area, possibly driving people from Guapest to the pueblo and the missions (Stoll et al. 2009).

The Tongva subsistence economy was centered on gathering and hunting. The surrounding environment was rich and varied, and the tribe exploited mountains, foothills, valleys, deserts, riparian, estuarine, and open and rocky coastal eco-niches. Like that of most native Californians, acorns were the staple food (an established industry by the time of the early Intermediate Period). Acorns were supplemented by the roots, leaves, seeds, and fruits of a wide variety of flora (e.g., islay, cactus, yucca, sages, and agave). Fresh water and saltwater fish, shellfish, birds, reptiles, and insects, as well as large and small mammals, were also consumed (Bean and Smith 1978; Kroeber 1925; McCawley 1996).

A wide variety of tools and implements were used by the Tongva to gather and collect food resources. These included the bow and arrow, traps, nets, blinds, throwing sticks and slings, spears, harpoons, and hooks. Groups residing near the ocean used oceangoing plank canoes and tule balsa canoes for fishing, travel, and trade between the mainland and the Channel Islands (McCawley 1996).

Tongva people processed food with a variety of tools, including hammerstones and anvils, mortars and pestles, manos and metates, strainers, leaching baskets and bowls, knives, bone saws, and wooden drying racks. Food was consumed from a variety of vessels. Catalina Island steatite was used to make ollas and cooking vessels (Blackburn 1963; Kroeber 1925; McCawley 1996).

At the time of Spanish contact, the basis of Tongva religious life was the Chinigchinich cult, centered on the last of a series of heroic mythological figures. Chinigchinich gave instruction on laws and institutions, and also taught the people how to dance, the primary religious act for this society. He later withdrew into heaven, where he rewarded the faithful and punished those who disobeyed his laws (Kroeber 1925). The Chinigchinich religion seems to have been relatively new when the Spanish arrived. It was spreading south into the Southern Takic groups even as Christian missions were being built and may represent a mixture of native and Christian belief and practices (McCawley 1996).

Deceased Tongva were either buried or cremated, with inhumation more common on what is now the Channel Islands and the neighboring mainland coast, and cremation predominating on the remainder of the coast and in the interior (Harrington 1942; McCawley 1996). Cremation ashes have been found in archaeological contexts buried within stone bowls and in shell dishes (Ashby and Winterbourne 1966), as well as scattered among broken groundstone implements (Cleland et al. 2007). Archaeological data such as these correspond with ethnographic descriptions of an elaborate mourning ceremony that included a wide variety of offerings, including seeds, stone grinding tools, otter skins, baskets, wood tools, shell beads, bone and shell

ornaments, and projectile points and knives. Offerings varied with the gender and status of the deceased (Johnston 1962; McCawley 1996; Reid 1926). At the behest of the Spanish missionaries, cremation essentially ceased during the post-contact period (McCawley 1996).

2.3 Pre-Incorporation Gardena Valley (1781–1929)

European settlement in the Los Angeles area began in the eighteenth century. In 1781, a group of 11 Mexican families traveled from Mission San Gabriel Arcángel to establish a new pueblo called El Pueblo de la Reyna de Los Angeles (The Pueblo of the Queen of the Angels). This settlement consisted of a small group of adobe brick houses and was called the Ciudad de Los Angeles (City of Angels). Outside of the pueblo were various ranchos where Mexican land grants were awarded to favored friends, acquaintances, and family of Spanish and later Mexican government officials. One such rancho that encompasses the project site was Rancho San Pedro (43,119 acres), awarded to Juan Jose Dominguez in 1784 (Figure 3). The Mexican–American War from 1846 to 1848 ended with Mexico ceding the Alta California lands to the United States, and the quick establishment of land ownership via court orders and surveys soon followed. The County of Los Angeles was established on February 18, 1850, and Ciudad de Los Angeles incorporated on April 4, 1850. Settlement of the Los Angeles region continued in the early American Period. Despite distinctive moves to become more urban, agriculture and cattle ranching retained its importance through the late 1860s and 1870s (Dumke 1944; Fogelson 1993; Leonard and Cost 1934; Roseman et al. 2004).

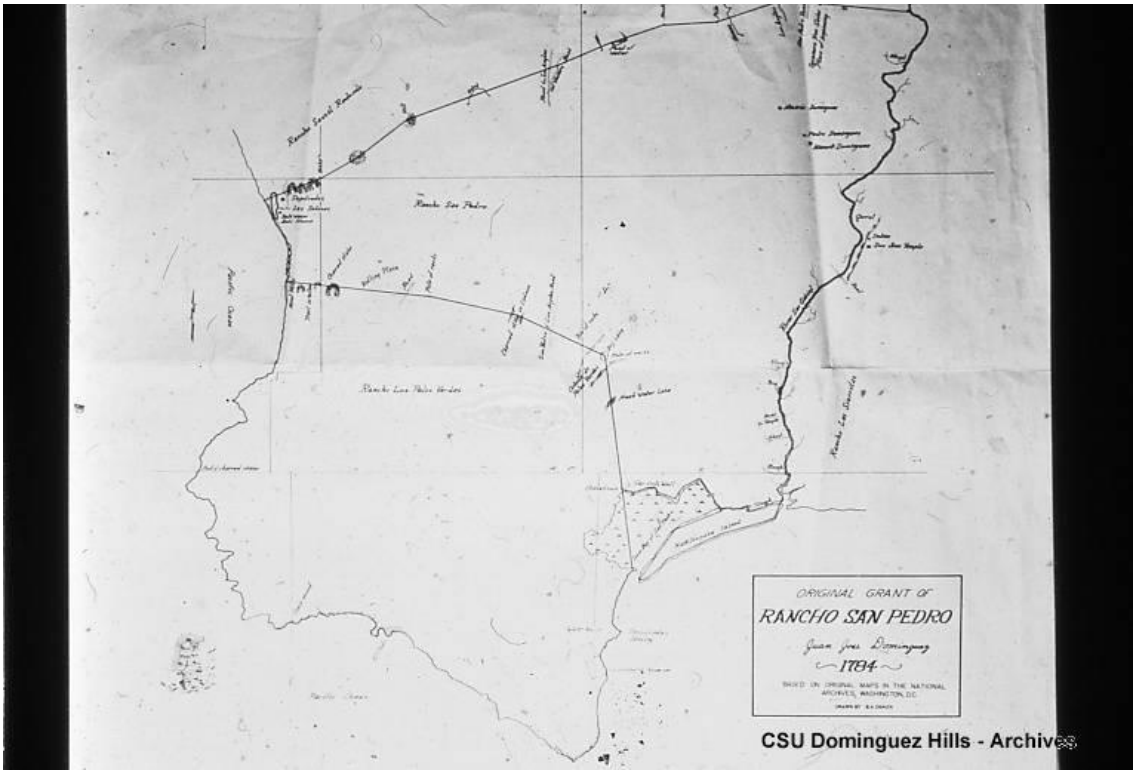

Figure 3. Original Grant of Rancho San Pedro to Juan Jose Dominguez, 1784 (California State University Dominguez Archives)

After the Mexican–American War, the Treaty of Guadalupe Hidalgo provided that the Mexican Land grants would be honored. U.S. officials required that all Mexican land claims be proven before they were patented. Dominguez's heirs successfully patented their father's land claim in 1858 to Rancho San Pedro. Their possession of the entire land claim was short-lived. In 1867, after the American Civil War, Union Army Major General William Starke Rosecrans, bought 16,000 acres of Rancho San Pedro and renamed it the Rosecrans Rancho. The Rosecrans Rancho borders consisted of Crenshaw Boulevard to the west, Florence Avenue to the north, Central Avenue to the east, and Redondo Beach Boulevard to the south. The Rosecrans Rancho was further subdivided in the 1870s for $50 an acre and broken into several distinct parcels. A Basque emigrant named Domingo Amestoy bought 800 acres from Rosecrans in 1875 and established what would later become the village of Strawberry Park. Around 1880, Jim McDonald, a stage driver between San Pedro and Los Angeles, purchased 1,300 acres from Rosecrans, and by 1887, real estate developers began advertising land in the McDonald Tract, south of Amestoy and Rosecrans's lands, anticipating the route of the Los Angeles and Redondo Railway (LA&R) (Figure 4). The McDonald Tract encompassed the lots between 190th Street, Normandie Avenue, Redondo Beach Boulevard, and border of the City of Hawthorne. Because of the Dominguez Slough running through the McDonald tract, centuries of colluvium soil deposits made the surrounding area excellent for farming. The developers originally platted the town center near Figueroa Street, but when the railway came to town, it followed Vermont Avenue instead. Residents shifted their homes and the town core to be closer to Vermont and 166th Street in 1889 (LACL 2019; Leonard and Cost 1934; Osborne 2008a, 2008b, 2008c).

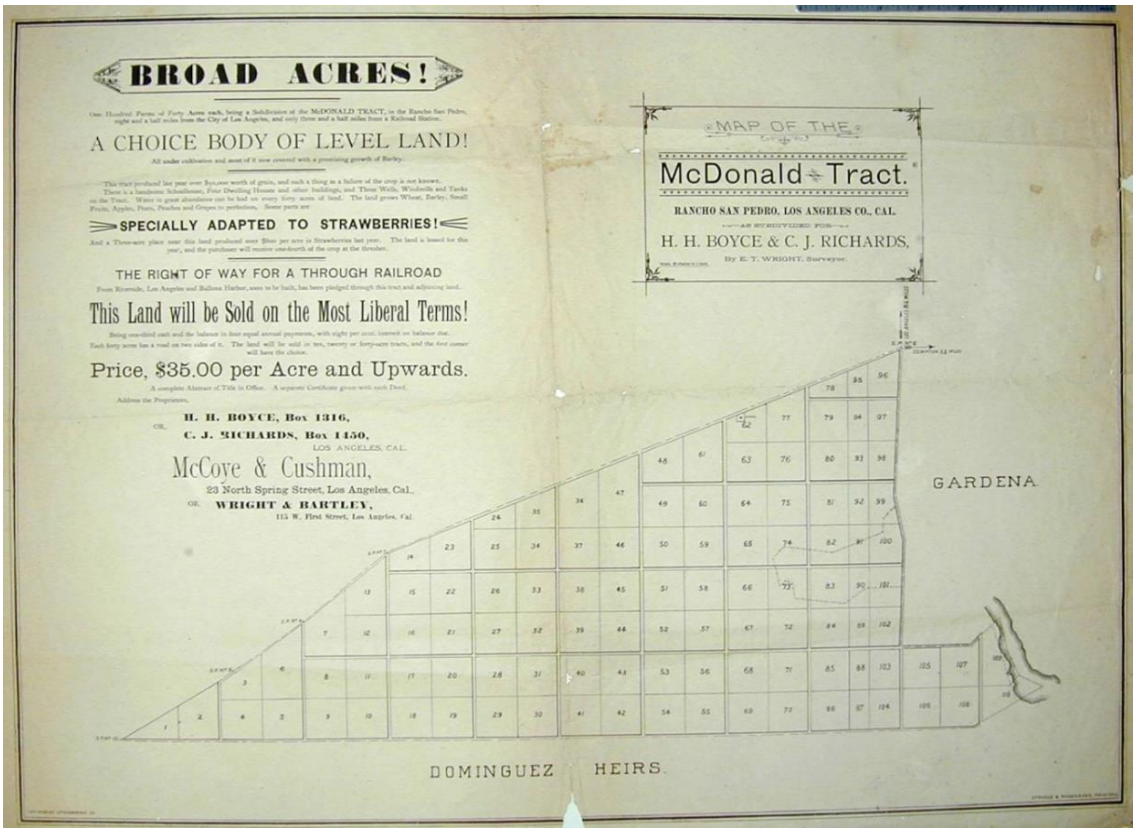

Figure 4. Advertisement for the McDonald Tract, 1887 (Huntington Library Map Collection)

Gardena Valley and the surrounding communities of Moneta, Broad Acres, Rosecrans, and Strawberry Park became locally important berry producers in the late 1890s because of the excellent soil and promotion of the land. By the turn of the twentieth century, the unincorporated town of Gardena had a bustling commercial core main street near the LA&R railway, a grammar school, churches, and several large homes, and was surrounded by berry and melon raising fields, orchards, and alfalfa tracts. Gardena Valley could be easily accessed from Los Angeles and Redondo Beach by two Pacific Electric Railway lines. Its proximity to Los Angeles afforded it extra amenities such as electric lights and telephone service. In 1906, the City of Los Angeles annexed the Shoestring Addition, which ran adjacent to Gardena's eastern border. The investment potential in the proximal arm of the City Los Angeles prompted the conversion of the high school, built just a few years earlier in 1904, into an agricultural high school (Creason 2015; Gardena Reporter 1907; Gnerre 2018a; LACL 2019; LAT 1910).

Gardena Valley and its communities remained largely rural, agricultural producers, even into the twentieth century. From 1890 to 1900, agriculture mostly involved poultry or berry production. Many Chinese and Japanese immigrants moved to the area to raise hundreds of acres of berries for white landowners. The area's success with berry production reached a point where Gardena was known as "Berryland" in the 1910s. Between 1913 and 1917, Gardena held an annual Strawberry Day Festival that rivalled Pasadena's Tournament of Roses and the San Bernardino Orange Show, drawing tens of thousands of people to the festival. With increases in agricultural production, access to water became an issue of concern. Surface wells were dug, but alkaline water at 24 feet deep created a natural hindrance to growth. A nearby artesian well on the old Dominguez Rancho lands was eventually rediscovered and enlarged, and a water company was formed to sell the artesian well water to Gardena (LACL 2019; LAT 1910; Leonard and Cost 1934; Ueda 2017).

The Japanese population grew in Gardena after the 1906 earthquake prompted the migration of Japanese people from San Francisco to the Los Angeles region. In 1907, 253 Japanese residents were recorded in Gardena. From nearly the beginning, Japanese immigrants or Americans of Japanese descent began to take up the difficult agricultural labor in the Gardena area. In 1906, one of the first Japanese organizations, the Moneta Strawberry Growers Association, was founded (Figure 5). This was followed by the Moneta Japanese Institute, founded and built in 1911. In 1916, a Japanese language school was opened. The Japanese population in Gardena waned slightly after two Alien Land Laws were passed in 1913 and 1920, barring first-generation immigrants from owning lands, aimed at the growing Japanese and Chinese emigrant population in California. By 1940, Gardena's Japanese population broke 5%, at 340 of the total 5,509 (LACL 2019; LAT 1911; Ueda 2017).

Figure 5. Japanese Family in a Gardena Strawberry Farm, 1912 (Los Angeles County Library, Mayme Dear Branch)

2.4 City of Gardena (1930–Present)

Gardena and the surrounding towns of Moneta, Western City, and Strawberry Park resisted individual incorporation or annexation to the City of Los Angeles for many years. By 1930, the population of the valley had reached 1,957 with no government except for Los Angeles County services. This situation would have continued undisturbed except for three situations that prompted the incorporation of the city. The first of these was Alondra Park. Part of a civic improvement project for the communities of Redondo Beach, Inglewood, Hawthorne, Torrance, and Gardena, Alondra Park was estimated to cost more than $1.1 million in 1926. Not wishing to assume the tax burden, Redondo Beach, Inglewood, Hawthorne, and Torrance voted to withdraw from the improvement project, leaving unincorporated Gardena to shoulder the entire debt. Gardena Valley residents could not assume the debt and defaulted to the County of Los Angeles, which assumed payments. At the same time, nearby cities were annexing portions of the Gardena Valley, including Long Beach acquiring a large tract in the valley for North Long Beach, and Torrance gaining a large portion of Moneta in 1930. Furthermore, unincorporated Gardena Valley was forced into the Hollywood Palos Verde Highway Assessment District, ceding even more of Gardena to outside interests. The only protection from these threats was incorporation. The Board of Supervisors declared the City of Gardena's incorporation as a

sixth class city in August 1930, and incorporation was approved on November 12, 1930, by all districts except Western City and Lawndale. As a result, the land incorporated stretched from 139th to 180th Street, between Vermont and Arlington Avenues (Figure 6) (Gardena City Clerk 1968; LAT 1930; Leonard and Cost 1934).

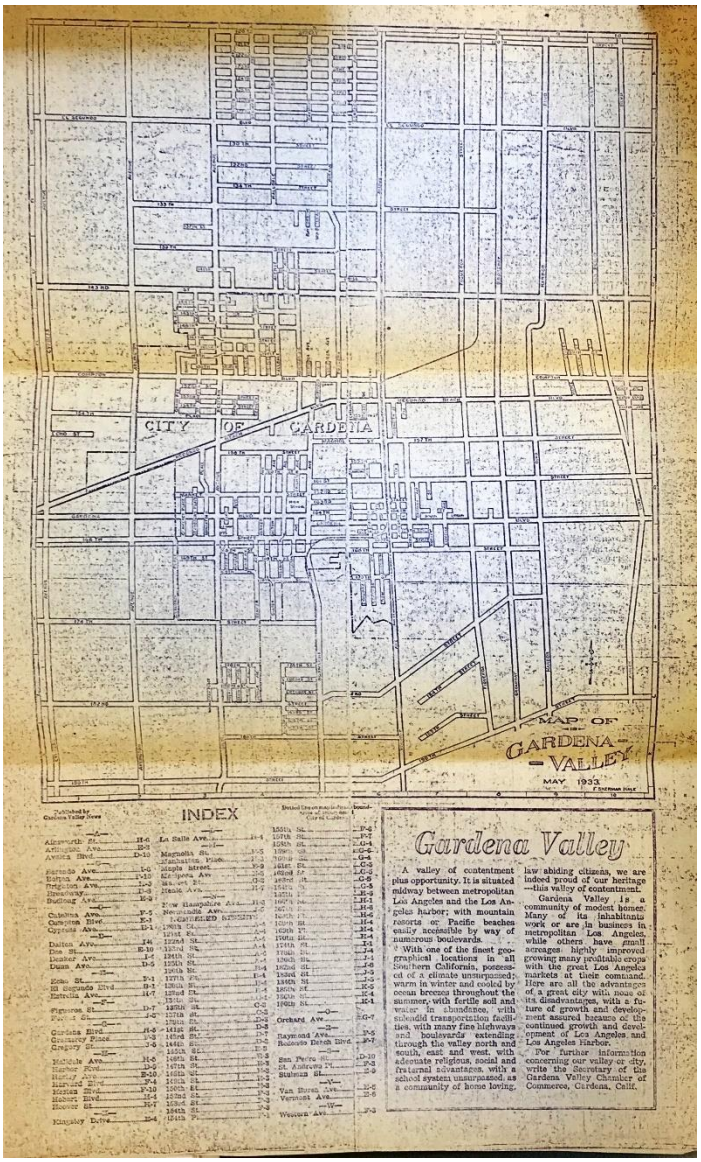

Figure 6. Gardena Valley Map, 1933 (Local History Collection, Los Angeles County Library, Mayme Dear Branch)

In 1936, gaming magnate Ernie Primm started the first card club in Gardena, Embassy Palace. This was based on the assumption that California law did not specifically outlaw poker, which prohibited other types of gambling. This was eventually tested in the California courts, which eventually ruled that poker and gaming were not illegal. Gaming soon became a major attraction to the area, and propelled much of its pre-WWII growth. Two new clubs opened in the 1940s, Western Club (1940) and Normandie Clue (1947). Eventually, six clubs—Normandie, Rainbow, Monterey, Embassy, Gardena, and Horseshoe—would be successful in the

City of Gardena up through the 1960s, despite multiple ballot measures to close them down (Gardena City Clerk 1968; Gnerre 2013; GVN 2001).

Between 1940 and 1950, the population of Gardena nearly tripled from 5,909 to 14,405. Despite its Japanese citizens being forced from the City of Gardena during World War II, many Japanese and their families returned to Gardena after conclusion of the war. The reestablishment of Japanese Americans, mingled with the post-war population boom felt throughout California, meant that Gardena and many other Los Angeles-region suburbs experienced prolific growth in the late 1940s and 1950s. Nightlife also grew. The success of the card clubs established in the 1940s brought other entertainment venues to the small town, including the Carrell Speedway racetrack in 1940, the Vermont Drive-In theater in 1944, Park Theater in 1947, The Hitching Post nightclub in 1951, and The Colony Club burlesque club (ca. 1950) (Brown 2004; Gardena City Clerk 1968; Gnerre 2018b, 2018c).

By act of State Legislature in 1955, all sixth class cities, including Gardena, were reclassified as General Law Cities, meaning Gardena had no charter other than the ordinances and resolutions passed and adopted by the City Council and the State of California. With population growth expanding from 14,405 in 1950 to 35,800 in 1960, this classification was expected. More civic improvements came with the construction of the Harbor Freeway (Interstate 110) in the late 1960s (City of Gardena 1992; Gnerre 2018b).

In the 1950s, the project site along West Artesia Boulevard began to develop in earnest. According to aerial photographs, the agricultural nature of the area diminished in these years, gradually replacing orchards and agricultural fields with commercial and industrial businesses. The historical Dominguez Slough flood plain begins around West Artesia Boulevard, and the 1940s channelization of the slough section likely contributed to development along West Artesia Boulevard. As noted in the aerial photographs taken in 1952 and 1956, the increase in residential subdivision development is unavoidable (Figure 7). By 1960, small-scale commercial-industrial buildings dominated the north side of West Artesia Boulevard on the project site. Residential subdivisions and residential trailer parks are also notably present on the project site. By 1967, all remnants of the agricultural uses in the area had completely given way to commercial, small-scale industrial and residential development on the project site. There are few changes to the project site after 1970. Some of the larger industrial warehouses and plants were exchanged for shopping centers, and many of the single-family homes on major arterial streets were exchanged for multi-family homes (AMI 1967; FAS 1956, 1960; PAI 1952; Tachibana 1981).

Figure 7. Aerial Imagery of Project Site Illustrating Growth, 1952 (left), 1960 (right); West Artesia Horizontal in Middle-Bottom of Photograph; Major Vertical Streets from Left to Right: Gramercy Place (Illinois Street) and Western Avenue (FAS 1960; PAI 1952)

2.5 Sanitation Districts of Los Angeles County

The LACSD was formed in 1923, an outcome of the County Sanitation Act as passed by California State Legislature. The concept was the result of ongoing sewage issues in the growing metropolitan area south of Los Angeles. In the early 1920s when the LACSD was being first considered, more than 500 water companies dispensed in Los Angeles County. Few of the existing sewers and disposal systems were adequate for the growing towns and cities. Rather than solve individual city's sewage problems piecemeal, the County Sanitation Act proposed to make sewerage the jurisdiction of Los Angeles County as a whole, with future growth of the region in mind. In 1923, the Los Angeles County population was already 1,300,000, with 775,000 of those living inside the City of Los Angeles and its 40 incorporated cities. Of the 32 incorporated Los Angeles County cities in the proposed LACSD area, 19 lacked sewer systems and depended entirely on cesspools and septic tank systems for residential and industrial waste. The County Sanitation Act was also formulated with the City of Los Angeles Hyperion disposal and ocean outfall plant in mind, and its ongoing legal issues with discharging sewage into the ocean near the growing upscale communities of Santa Monica and other beachside cities (LAT 1923; Rawn 1965).

The LACSD was proposed in 1924. Los Angeles County Chief Engineer Albert K. Warren established eight districts. Of these eight districts, three failed to authorize elections and were later dissolved, leaving only five sanitation districts in the County of Los Angeles' control. The project site was in District No. 5, which was defined as encompassing Inglewood, Hawthorne Lawndale, Gardena, Torrance, Lomita, and the Palos Verdes Hills. Eventually, the City of Los Angeles' Shoestring Addition was also served by District No. 5. A total of

$10 million in bonds for District No. 5's sewers were approved in 1924, and the sewer construction project began in Inglewood in September 1925. Although there were initial reservations concerning the outfall plant to be placed near Los Angeles Harbor, the matter was approved in hearings by the California State Board of Health in 1926, and finally permitted in 1927. In 1928, the LACSD's main trunk line was completed and connected to the South Bay Cities Sanitation District system (completed in 1926) (LAT 1924, 1925, 1926, 1927a, 1927b, 1928; Rawn 1965).

Overview of Project Buildings

Gardena Pumping Plant (1928), Addition (1960)

According to LACSD records, Assistant Chief Engineer A M Rawn approved the original Gardena Pumping Plant (pumping plant No. 1) in February 1928, although the original designer is unknown. The original pumping plant was designed by County of Los Angeles engineers and approved by A M Rawn and Chief Engineer A.K. Warren (Figure 8). The original designers are not named on the engineering plans (LACSD 1928).

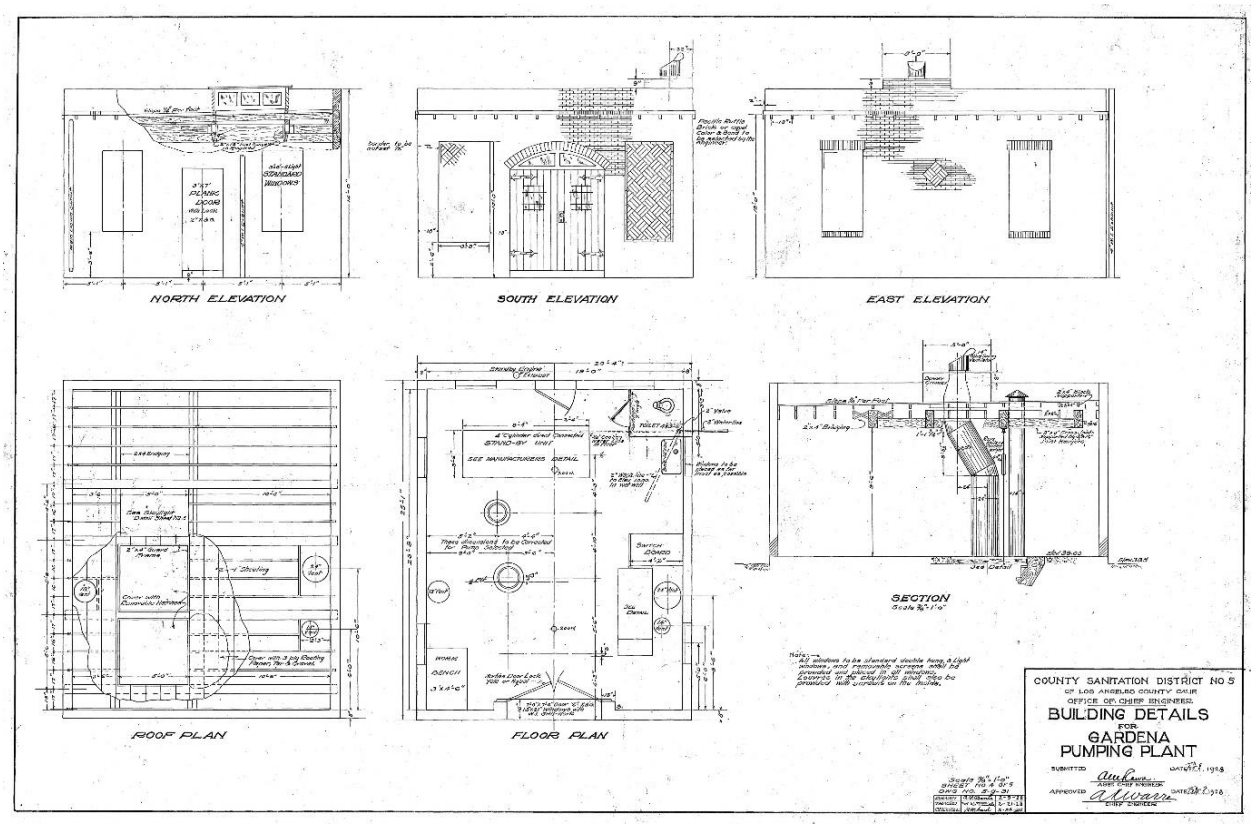

Figure 8. Sheet 5. Building Details for Gardena Pumping Plant, 1928 by A M Rawn (LACSD Records)

In 1960, a second pumping plant was added to the 1928 plant, increasing the pumps from two to four total pumps, likely in response to the increase in Gardena's population from 1,957 in 1930 to 35,800 in 1960.

1923 West Artesia Boulevard (1957)

Permits held by the City of Gardena indicate that 1923 West Artesia Boulevard was constructed between 1957 and 1958. Architectural drawings by H.L. Standefer detail the bowstring truss roof system and Mid-Century Modern concrete and stone veneer front elevation details. The original owner was recorded as Harry Howard. Owners are recorded partially by permits and are outlined below:

- Fred Wifford (1958)
- Aero Missile Products (1959)
- HLW Corporation (1960)
- KAAG Trophy (1963)
- Spherical Products/George Bowen (1967)
- Leone Bower (1995)

1931 West Artesia Boulevard (1954)

Permits held by the City of Gardena indicate that 1931 West Artesia Boulevard was constructed in 1954. Original drawings were not filed with the City of Gardena. The original owner was recorded as Sylvia J. Byrd. Owners are recorded partially by permits and are outlined below:

- John E. Byrd (1957)
- Earl J. Byrd (1978)
- Jim Monda (1985)
- Chong Chi (2003)
- Thinh Duc Hoang (2009)

Engineers/Architects

H.L. Standefer (ca. 1921–?)

Details about H.L. Standefer's life could not be ascertained. According to a few sources such as newspaper articles and copies of *Architect and Engineer*, Standefer typically worked on residential developments or industrial park complexes in the greater Los Angeles area. He maintained offices in Studio City and North Hollywood between 1950 and 1981. A short list of some of Standefer's work was compiled from archival research (IPT 1950; LAT 1964, 1979, 1981; Wilder 1952, 1957, 1958):

- 250-House Residential Development, Torrance, 1950
- Lockheed Employee Activity Building, Burbank, 1952

- Auto Repair Garage, North Hollywood, Los Angeles, 1957
- Concrete Block Machine Shop, Burbank, 1957
- J.B. McGalliard Warehouse, Los Angeles, 1958
- Restaurant and Warehouse, West Los Angeles, 1958
- Aerospace Plant Addition, Stainless Steel Products Inc., Burbank, 1964
- North Hollywood Industrial Park, Los Angeles, 1979
- Industrial Complex, Canoga Park, 1981

2.6 Architectural Styles of the Subject Properties

Brick Commercial (circa 1880–1940)

Brick Commercial buildings are prevalent throughout the entire United States prior to 1940 and were common in California in the post-statehood years through World War II. They are typically brick masonry buildings in free-standing or attached format as part of larger local commercial districts. In the eastern United States they may be taller, but in California, these brick commercial buildings are typically one to three stories. There is no single roof or cladding style, but a parapet typically hides the gabled or flat roof behind it, presenting a unified front elevation, while side and rear elevations lack distinctive decoration. Main elevations may have applied details from popular architectural styles, such as Neo-Classical columns and cornices, or modest geometric Art Deco decoration. The style is wide and encompassing, and includes the following (Longstreth 2000; Sapphos 2009):

- Brick masonry walls
- Attached or freestanding
- Recessed doorway
- "Sign band" between parapet and tops of fenestration
- Rectilinear forms
- Flat roof with parapet

Mid-Century Modern (1933–1965)

Mid-Century Modern style is reflective of International and Bauhaus styles popular in Europe in the early twentieth century. This style and its living designers (e.g., Mies Van der Rohe and Gropius) were disrupted by World War II and moved to the United States. During World War II, the United States established itself as a burgeoning manufacturing and industrial leader, with incredible demand for buildings to reflect modern products in the mid-twentieth century. As a result, many industrial buildings are often "decorated boxes"—plain buildings with applied ornament to suit the era and appear more modern without detracting from the importance of the activity *inside* the building. Following World War II, the United States had a focus on forward thinking, which sparked architectural movements like Mid-Century Modern. Practitioners of the style

were focused on the most cutting-edge materials and techniques. Architects throughout Southern California implemented the design aesthetics made famous by early Modernists like Richard Neutra and Frank Lloyd Wright, who created a variety of modern architectural forms throughout Southern California. Like other buildings of this era, Mid-Century Modern buildings had to be quickly assembled and use modern materials that could be mass-produced (McAlester 2013; Morgan 2004).

Key character-defining features of the Mid-Century Modern style included the following (Gebhard and Winter 2003; McAlester 2013; Morgan 2004):

- Low, boxy, horizontal proportions
- Mass-produced materials
- Flat, smooth sheathing
- Flat-roofed without coping at roof line; flat roofs hidden behind parapets
- Lack of exterior decoration or abstract geometrical motif
- Simple windows (metal or wood)
- Industrially plain doors
- Large window groupings
- Commonly asymmetrical
- Whites, buffs, and pale pastel colors

INTENTIONALLY LEFT BLANK

3 BACKGROUND RESEARCH

3.1 California Historical Resources Information System Records Search

Dudek requested a CHRIS records search from the South Central Coastal Information Center, which houses cultural resources records for Los Angeles County. Dudek received the results on January 14, 2019. The CHRIS search included any previously recorded cultural resources and investigations within a 1-mile radius of the project site. Additional consulted sources included historical maps of the project site; the NRHP; the CRHR; the California Historic Property Data File; and the lists of California State Historical Landmarks, California Points of Historical Interest, and the Archaeological Determinations of Eligibility. Confidential Appendix B provides the confidential results of the records search and a bibliography of prior cultural resources studies.

Previous Technical Studies

Results of the CHRIS search indicate that 27 previously conducted studies (1974 through 2013) were identified within the 1-mile records search radius. One of the studies, LA-10333 overlaps the project site, and one study, LA-10106, is directly adjacent to the southern border of the project site. Both LA-10333 and LA-10106 are discussed below. The remaining 26 studies are outside of the project site. Table 1 briefly summarizes all 27 studies.

SCCIC = South Central Coastal Information Center

Report No. LA-10106

Improvements to Artesia Boulevard (State Route 91) in the City of Torrance, Southwestern Los Angeles County (Shepard 2002, see Table 1), reported the results of a 2.5-acre archaeological inventory survey and summarized potential impacts to archaeological resources for a proposed improvements project for Artesia Boulevard in the City of Torrance. Shepard's reported project area encompassed the right-of-way along Artesia Boulevard between

Hawthorne Boulevard to the west and Western Avenue to the east. Shepard's project area ran along the southern boundary of the proposed project site. The records search and field survey yielded no cultural resources or sites associated with Shepard's project area. No other archaeological remains were discovered during the course of that survey.

Report No. LA-10333

A Brief Historic Context Statement Prepared for the General Plan Update: The City of Torrance, Los Angeles County, California (McKenna 2009, see Table 1), is a historic context statement for the City of Torrance, including a brief history of the city and a summary of known cultural resources within the city. The report's project area overlaps the proposed project site, which borders the City of Torrance at Gramercy Street less than 300 feet west of the proposed project site. The report presented a thorough review of the history of the city and a review of the cultural resources identified within the city. No resources were identified within or near the proposed project site as part of the report.

Previously Recorded Cultural Resources

No cultural resources have been previously recorded within the project site. The records search identified four previously recorded cultural resources within a 1-mile radius of the project site (Table 2). Three of the resources are historic built-environment resources—Dominguez Slough (P-19-177369), Gardena High School (P-19-190006), a steel lattice transmission tower (P-19-190646)—and one resource is a historic refuse deposit dating from the 1930s to the 1960s (P-19-004644). None of these resources have been found eligible for listing on the NRHP, CRHR, or local designations).

Table 2. Previously Recorded Cultural Resources within 1 Mile of the Project Site

Primary Number	Trinomial	Period	NRHP/CRHR Status	Year (Recorded By)	Description
P-19-004644	—	Historic	6Z; Found ineligible for NRHP, CRHR, or local designation through survey evaluation.	2015 (Hahlen, Jillian L., Brian F. Smith & Associates Inc.)	Historic refuse deposit related to commercial and residential use of the area between 1930 and 1960
P-19-177369	—	Historic	Not evaluated.	1981 (Unknown)	Dominguez Slough (also known as South Gardena Park Site)
P-19-190006	—	Historic	Not evaluated.	2011 (Campbell, Lex. F, Simpson Gumpertz & Heger Inc.)	Gardena Senior High School
P-19-190646	—	Historic	6Z; Found ineligible for NRHP, CRHR, or local designation through survey evaluation.	2013 (Crawford, K.A., Crawford Historic Services)	Southern California Edison Tower #M7-T4 Mea-Redondo, steel lattice type transmission tower

3.2 NAHC and Native American Correspondence

Dudek contacted the NAHC on behalf of LACSD on January 23, 2019, to request a search of its Sacred Lands File for the project site and surrounding area. The NAHC responded on January 25, 2019, indicating that the search failed to indicate the presence of Native American cultural resources for the project site. However, because negative results do not preclude the presence of Native American cultural resources within the area, the NAHC also suggested contacting Native American groups and/or individuals who may have knowledge of cultural resources in the project area, and provided a list of five such interested parties. On January 29, 2019, Dudek mailed letters to all five individuals listed on the NAHC consultation list (Table 3 and Confidential Appendix B). This outreach was conducted for informational purposes only and did not constitute formal government-to-government consultation as specified by Assembly Bill 52.

Table 3. Native American Heritage Commission–Listed Native American Contacts

Native American Tribal Representatives	Method of Notification/Date	Response Received
Anthony Morales, Chairperson San Gabriel Band of Mission Indians	Certified Mail Sent: January 29, 2019 Delivered: February 1, 2019	None to date
Sandonne Goad, Chairperson Gabrielino-Tongva Nation	Certified Mail Sent: January 29, 2019 Delivered: February 1, 2019	None to date
Robert F. Dorame, Chairperson Gabrielino Tongva Indians of California Tribal Council	Certified Mail Sent: January 29, 2019 Delivered: February 4, 2019	None to date
Charles Alvarez, Council Member Gabrielino Tongva Tribe	Certified Mail Sent: January 29, 2019 Delivered: February 1, 2019	None to date
Andrew Salas, Chairperson Gabrieleno Band of Mission Indians – Kizh Nation	Certified Mail Sent: January 29, 2019 Delivered: February 1, 2019	None to date.

3.3 Building Development Research

Extensive archival research was conducted in support of the historical significance evaluation of the six subject properties. Short descriptions of all research efforts are provided below.

Los Angeles County Sanitation Districts

Dudek requested internal records from LACSD on January 8, 2019. On January 18, 2019, LACSD responded with copies of engineer's drawing sets for the original 1928 building, the 1960 addition, and major alterations in 1970, as well as a daily report book from 1960, a daily report book from 1971–1972, and a copy of A M Rawn's 1965 *Narrative C.S.D* book (Chi Epsilon 2018; Fiala 2003). These records were used in the preparation of the historic context and for the description of surveyed resources.

City of Gardena, City Clerk Office

Dudek staff visited the City of Gardena Community Development Department on January 15, 2019, to pull permits for the three subject properties. These permits were used in preparation of the building descriptions and the historic context for this report (Section 2, Historic Context).

Los Angeles County Library – Mayme Dear Branch

Dudek staff visited the Mayme Dear branch of the Los Angeles County Library, located in the City of Gardena, on January 15, 2019. There, Librarian Wendy Lee and library staff pulled the local history materials and un-accessioned Gardena history materials for review. Dudek staff also reviewed a number of online resources available through the Los Angeles County Library's local history page for Gardena, California. Resources included directories, newspaper clippings, historical narratives, and a photograph collection, which were used in the preparation of the historic context for this report (Section 2).

Los Angeles Public Library

Dudek staff reviewed online resources and tools available through the Los Angeles Public Library website. These tools included accessing digitized Sanborn Maps, online TESSA photo collections, and the *Los Angeles Times* online historical newspaper collections, which were all used in preparation of the historic context for this report (Section 2).

Los Angeles County Office of the Assessor – Property Assessment Information System

Dudek used the Los Angeles County Assessor's Property Assessment Information System to access online assessor records to determine ages for buildings within and adjacent to the project site on January 8, 2019 (LAC Office of the Assessor 2019). Information obtained from the Property Assessment Information System was used to establish a building chronology used in preparation of the historic context (Section 2).

California State University Dominguez Hills Archives and Special Collections

Dudek visited the Archives and Special Collections at California State University, Dominguez Hills on January 9, 2018. There, Dudek reviewed the James H. Osbourne Gardena Photograph Collection, the Gardena Valley Chamber of Commerce Collection, the South Bay History Collection 1923–2005, and the 1981 City of Gardena Historic Resources Survey Report by Judi Tachibana. Resources were used in the development of the City of Gardena portion of this document's historical context (Section 2).

Sanborn Map Review

Sanborn Fire Insurance Company maps for the City of Gardena were available for the years 1908, 1912, and 1929, with an updated 1929 map. The project site is not covered by any of these maps, which only extend as far south as San Pedro Avenue (now 166th Street) and as far west as Illinois Street (now Gramercy Place). Sanborn maps were pulled from the ProQuest "Digital Sanborn Maps 1867–1970" website.

Aerial Photograph Review

Historic aerial photographs were available from Nationwide Environmental Title Research (NETR) for the years 1954, 1963, 1972, 1980, 1994, 2002, 2003, 2004, 2005, 2009, 2010, 2012, and 2014. Additional photographs were available from the Aerial Photograph Collection at the University of California Santa Barbara Map and Imagery Laboratory for the years 1927, 1938, 1941, 1947, 1952, 1956, 1960, 1962, 1967, 1971, 1976, 1979, and 1991 (AMI 1967, 1991; FAS 1927, 1941, 1947, 1956, 1960, 1962; Laval Company 1938; NETR 2019; PAI 1952; Teledyne Geotronics 1971, 1976, 1979).

In the earliest available aerial photographs of the site from 1927, the project site consists of an orchard surrounded by agricultural fields and the Dominguez Slough to the east. Van Ness Avenue, Artesia Boulevard, and Gramercy Place are already established and appear as dirt roads, and Western Avenue appears as a paved, two-lane road. The main corridor of Gardena is to the north along West 166th Street (then Gardena Boulevard), between Western Avenue and Vermont Avenue (FAS 1927).

The large orchard block continues to appear at the location of the Gardena Pumping Plant, but beginning with the 1938 aerial photograph, a single square plan building within a fenced lot is visible in the southeast corner of the orchard plot. It cannot be discerned from the aerial photographs if this is an agriculture-related building or if it is the Gardena Pumping Plant. Between the 1941 and 1947 photographs, the Dominguez Slough was formalized into the concrete-lined Dominguez Channel. From 1938 to 1947, the main area of Gardena between Western and Vermont Avenue along 166th Street began to expand to the east and west with the establishment of residential blocks. The agricultural fields and orchard regions around the project site gave way to residential neighborhoods by the 1947 and 1952 aerial photographs. A large industrial complex is present south of Artesia Boulevard and east of Western Avenue (FAS 1941, 1947; Laval Company 1938; PAI 1952).

Between the 1952 and 1956 aerial photographs, the commercial building at 1931 West Artesia Boulevard, now an E-S Technical Motorsports, appears. Between 1956 and 1960, the building at 1923 West Artesia Boulevard (now Majestic Lighting) appeared, as well as other automotive-commercial establishments west of the project site to Gramercy Place. Between the 1960 and 1962 aerial photographs, the Gardena Pumping Plant addition appears. By this time, residential blocks from Torrance have encroached from the west, and residential blocks and large commercial and industrial buildings begin to appear along Artesia Boulevard, eliminating all of the previously agricultural land from the surrounding area. Between 1956 and 1962, all of the industrial/commercial buildings and the mobile home park located between Artesia Boulevard, Gramercy Place, and the Dominguez Channel appear. There are few changes to the project site or surrounding area after the 1962 aerial photograph (AMI 1967, 1991; FAS 1956, 1960, 1962; NETR 2019; PAI 1952; Teledyne Geotronics 1971, 1976, 1979).

INTENTIONALLY LEFT BLANK

4 FIELD SURVEY

Dudek Architectural Historian Kate G. Kaiser, MSHP, conducted a survey of the project site on January 8, 2019. Ms. Kaiser, Dudek Project Manager Rachel Struglia, Dudek Environmental Analyst Sabrina Alonso, and representatives from the LACSD were given a short tour of the interior of the Gardena Pumping Plant, including the dry wells for the 1928 and 1960 portions of the building. During the survey, Ms. Kaiser surveyed all accessible portions of the buildings that were visible from the public right-of-way, and documented the buildings with detailed notes and photographs, specifically noting character-defining features, important spatial relationships, and any observable alterations to the building. Photographs of the project site were taken with a 16-megapixel Canon PowerShot ELPH180 camera. All field notes, photographs, and records related to this survey are on file at Dudek's Pasadena, California, office.

4.1 Description of Surveyed Resources

The project site is consists of three buildings on the north side of Artesia Boulevard: the Gardena Pumping Plant at 1919 West Artesia Boulevard (APN 4094-007-903), Majestic Lighting building at 1923 West Artesia Boulevard (APN 4094-007-005), and the E-S Technical Motorsports building 1931 West Artesia Boulevard (APN 4094-007-004). All buildings discussed below were constructed more than 45 years ago. California DPR Series 523 Forms were prepared for all built-environment resources and are provided in Appendix C, per Office of Historic Preservation standards (OHP 1995).

Gardena Pumping Plant, 1919 West Artesia Boulevard (APN 4094-007-903)

The Gardena Pumping Plant is a one-story brick pumping plant located in the southwest portion of the City of Gardena (Figure 9). The building is located on a 50-foot by 75-foot lot fronting West Artesia Boulevard among several small-scale automotive and industrial buildings. The building has a rectangular plan with a smaller rectangular addition on its west side, and a flat roof with parapet. The pumping plant resembles the brick commercial-style building seen most commonly in commercial architecture, despite its use as a public utility building. It also has some secondary Neo-Classical-influenced decoration, including common (American) bond brickwork, a decorative header belt course and dentil band below the parapet, an arched entry on the 1928 building, and a basket-weave section of decorative brickwork on the front elevation flanking the door. On the 1960 addition, the header belt course is repeated, but the other decorative elements are lost: the brick bond is stretcher-only, suggesting it is a brick façade over a brick building; the double door only has a flat arch soldier course; and there are no flanking decorative brickwork as with the basket-weave on the 1928 building.

Figure 9. Overview of Main (South) Elevation, with 1928 Original Pumping Plant on right, and 1960 Addition on Left (1/8/2019, IMG_01744)

The main (south) elevation faces West Artesia Boulevard. The south elevation has two clearly defined halves, the 1960 addition (left) and the 1928 original building (right). Both are symmetrically arranged with metal double door in the center of the elevation. The left building (1960) has no other decoration, other than a soldier course flat arch over the door and a belt course below the parapet. The left building brickwork is stretcher bond only, and has a lighter-colored, raked orange brick compared to its 1928 neighbor. There is a small gap between buildings, but this gap is only cosmetic and the buildings clearly share a wall on the interior. The right building (1928) is symmetrical, with two basket-weave brickwork sections flanking the centered double door with an arch, and a belt and dentil course below the parapet. The belt and dentil course is present on all visible elevations of the 1928 building (south, east, north, and visible portion of west). This elevation features common bond, raked, dark red-brown bricks in the 1928 building. The west elevation of the 1960 building features stretcher bond bricks, and continues the belt coursed below the parapet. It has two large, evenly spaced infilled windows with concrete sills, and soldier course flat arches above them. Continuing clockwise around the building, the north (rear) elevation presents as two distinct halves. The left (1928) section protrudes roughly 5 feet farther north than the right (1960) section. The left section has common bond brickwork and two infilled windows flanking a single metal door with a flat arch. The infilled window brickwork clearly does not match the structural brickwork, and appears to be a later repair. The right (1960)

section also has two infilled windows flanking a single metal door, but, like its main elevation, it features stretcher bond bricks and a belt course for its only decoration. The north elevation also has several objects attached to the building exterior, including gutters scuppers for the roof at the parapet line, lights, pipes, utility boxes, and an exhaust fan. The east elevation is only visible for the 1928 building. This elevation features common bond bricks with two infilled windows with concrete sill and flat arch still visible. There is also a single, 12-brick basket-weave pattern in a diamond orientation centered between the two windows.

There are several other structural elements to the Gardena Pumping Plant. Because it is connected to the sewer system, there is an extensive belowground component consisting of a wet well near the front portion of the lot and two dry wells, one under each building, extending 26 feet below the ground level. Access to the dry wells are through the interior. The dry well structures are board-formed concrete in the 1928 building and plywood-formed concrete in the 1960 addition. Access to the wet well is through a cement collar and pressed aluminum metal hatch at the ground level, directly in front of (south) the west portion (1960) of the building. There are several such access points to the wet well on the paved section of lot in front of the building.

Alterations

There were two major and several minor alterations to the Gardena Pumping Plant. The most notable of these is the 1960 addition of a second pumping plant, and a 1971–1972 project to update the plant. In 1960, a second pumping plant was deemed necessary to accommodate the growing demands on the 1928 pumping plant. These alterations included the addition of a below-ground wet and dry well, an above-ground building constructed of brick that shared the west wall of the 1928 pumping plant building and would house two pumps, and electrical equipment sufficient to automate the plant. Contractors involved included Domar Electric, Barney's Drilling Service, Pacific Crane and Rigging, Blue Diamond Steelmen, Asher's Concrete Cutting Co., Rosencrans Construction Co., and Midway Construction Co. LACSD employees completed the remainder of the construction work. Construction of the 1960 pumping plant began on May 31, 1960, and concluded on December 9, 1960 (LACSD 1960) (Permits E3995 and B6518).

In 1972, another major construction project took place at the Gardena Pumping Plant. This involved repaving the blacktop on the lot, installing new electrical transformers, replacing existing electrical conduit into building and dry well, installing a new diesel generator, installing control panels, demolishing the 1928 wet well, creating a new wet well, and removing and replacing the 1928 building main elevation door. Contractors included Jenkin Construction Company, Ashcraft Electric, Barney's Drilling Service, Signal Steel Co., L.A. Door Repair Corp., Amex Paving, and Superior Coatings Paint. Construction of the 1972 alterations began on June 21, 1971, and concluded on October 5, 1972 (LACSD 1972) (Permit B15884).

During the survey, one alteration was observed. Between 1972 and the present, all of the windows on the west, north, and east elevations were infilled with brick. These alterations were not included on any of the permits, plans, or narrative descriptions of other alterations.

Majestic Lighting, 1923 West Artesia Boulevard (APN 4094-007-005)

The Majestic Lighting building at 1923 West Artesia Boulevard is located immediately west of the Gardena Pumping Plant lot. The building, built in 1957, is a one-story Mid-Century Modern Style commercial building located on a 50- by 150-foot lot fronting West Artesia Boulevard, among several small-scale automotive and industrial buildings and the Gardena Pumping Plant (Figure 10). The building features a rectangular plan with no noted additions, and the roof features a rounded, bowstring truss system. Exterior wall cladding on the main elevations features mostly smooth yellow-painted concrete with applied stone veneer around the entrance. Several electric lights are affixed to the main elevation. From left to right, fenestration on the main elevation consists of a multi-lite window in metal frame, a glass double door with glass side-lite, and a gated garage door at the far right side. The only other accessible elevation was the east elevation, which was a painted concrete masonry unit wall with no decoration or fenestration. The roof system features a rounded, bowstring truss system. The building is set back against the rear portion of the lot, facilitating parking in the paved front of the lot. Near the public right-of-way portion of the lot is the majestic lighting sign, rendered yellow and in the shape of a crown with an "M" on it.

Figure 10. Overview of Main (South) Elevation of the Majestic Lighting Building at 1923 West Artesia Boulevard (1/8/2019, IMG_1729)

Alterations

The following alterations were determined from permits, on file at the City of Gardena Community Development Department:

- New building, 1957 (Permit B3201)
- Install 4-hour fire wall, 1958 (Permit B3706)
- Interior addition of commissary and two offices, 1960 (Permit B7226)
- Install air-conditioning unit, 1967 (Permit B126867)
- All new electric, 1967 (Permit E8846)
- Repair fire damage, replace roof structure, 1967 (Permit B12724)
- Replace roofing, 1994 (Permit 6886)

E-S Technical Motorsports, 1931 West Artesia Boulevard (APN 4094-007-004)

The E-S Technical Motorsports building at 1931 West Artesia Boulevard is located west of the Majestic Lighting lot. The building, constructed in 1954, is a one-story Mid-Century Modern style commercial building located on a 50- by 150-foot lot fronting West Artesia Boulevard among several small-scale automotive and industrial buildings, and the Gardena Pumping Plant (Figure 11). The building features a rectangular plan with an addition on the north elevation. The roof system appears flat with a high parapet wall on the front (south) elevation and side elevations. Exterior wall cladding on the main elevation features smooth white concrete, with red trim decoration, with brick trim at the bottom of the wall. A flat awning, trimmed with red, spans the elevation separating the fenestration from the signboard. Fenestration consists of two sets of metal-framed, two-lite display windows and two glass doors with a metal-framed transom. Red-painted gutters and scuppers are visible on the front elevation, one at either end. The sign is a modern metal-framed, LED-lit sign. The entire lot and rear buildings were not visible during the course of survey. The visible portion of the east elevation cladding is red-painted concrete masonry unit blocks with no fenestration. The visible portion of the west elevation is also red-painted concrete masonry unit blocks with two one-over-one sash windows covered with metal security bars. A portion of the east elevation of the rear addition was visible from the public right-of-way, and it is red-painted concrete masonry unit blocks with a white-painted metal roll-up garage door. No other elevations were visible or accessible during the survey. There is some space in the front lot for parking and a signpost, but the signboard at the top is empty.

Figure 11. Overview of 1931 West Artesia Boulevard Looking Northeast (1/8/2019, IMG_1733)

Alterations

Two alterations were determined from permits on file at the City of Gardena Community Development Department: interior renovations in 2003 (Permit M0304-008, B0301-055) and permits to install forced air heating/cooling system (Permit M1912) in 2000. No other alterations were noted during the survey.

5 SIGNIFICANCE EVALUATION

5.1 Gardena Pumping Plant (1928, 1966)

NRHP/CRHR Statement of Significance

In consideration of the project site's history and requisite integrity, the Gardena Pumping Plant is recommended not eligible for listing in the NRHP or CRHR based on the following significance evaluation.

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research identified that the original 1928 Gardena Pumping Plant was likely designed and built during the initial LACSD campaign to build out Sanitation District No. 5 infrastructure, including sewer trunk lines, branch lines, wells, and other pumping stations. District No. 5 was built concurrently with District Nos. 1, 2, 3, 4, and 8. This was part of a Los Angeles County–wide push for sanitation infrastructure in the early twentieth century to accommodate population growth in the proposed sanitation districts and to promote or entice industrial development to establish in Los Angeles County. However, the role of the Gardena Pumping Plant in this campaign is trivial. The subject pumping plant was one of several plants working as part of a larger infrastructure system to keep sewage moving to the outfall plant at White's Point. Moreover, the building has undergone several alterations and a large addition from 1960 that have diminished its integrity and its ability to convey an association with the 1925–1930 Sanitation District infrastructure project. Therefore, the Gardena Pumping Plant does not appear eligible under NRHP/CRHR Criteria A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, the Gardena Pump Plant does not appear eligible under NRHP/CRHR Criteria B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Gardena Pumping Plant is not a distinctive or remarkable example of the early twentieth century commercial style, and has had several major alterations, including new doors, window infill, and a 1960 addition clearly visible from the main elevation. It retains some minor character-defining features such as the decorative basket-weave brickwork on the 1928 building, and the belt course and dentil band below the parapet. An LACSD engineer designed the Gardena Pumping Plant, but the name of the designer could not be determined from the engineering plans. The building does not possess high artistic value and is not a significant or distinguishable entity. For all of these reasons, the Gardena Pumping Plant does not appear eligible under NRHP/CRHR Criteria C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that Gardena Pumping Plant has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, the Gardena Pumping Plant is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: Gardena Pumping Plant is sited on the original location of construction in its original orientation. Therefore, Gardena Pumping Plant retains integrity of location.

Design: Gardena Pumping Plant was subjected to several extensive exterior alterations over time that compromise its integrity of design, including a 1960 addition visible from the main elevation, rendered in a different style with window infill on the west, north, and east elevations; a new door; and arched entry infill for the 1928 building. Therefore, the Gardena Pumping Plant does not retain integrity of design.

Setting: The setting of the Gardena Pumping Plant has changed significantly since the original 1928 building was built, including the slow replacement of orchards and agricultural fields with small-scale industrial and commercial buildings and complete urbanization of the Gardena Valley area. Therefore, Gardena Pumping Plant does not retain integrity of setting.

Materials: Numerous alterations to the Gardena Pumping Plant have compromised the property's material integrity, including a 1960 addition, window infill, and new doors. Even though brick material was used for the 1960 addition and window infill, there has been material loss of all original fenestration. Therefore, Gardena Pumping Plant no longer retains integrity of materials.

Workmanship: Similar to the issue with materials, the physical evidence of a craftsman's skills in constructing the original Gardena Pumping Plant building was compromised by the alterations and additions. Therefore, the Gardena Pumping Plant no longer retains its integrity of workmanship.

Feeling: The Gardena Pumping Plant does not convey the feeling of an early twentieth century utility building, since subsequent alterations and additions negatively affected the building's ability to convey this feeling. Therefore, the Gardena Pumping Plant no longer retains integrity of feeling.

Association: An important historical association between the Gardena Pumping Plant and efforts to introduce comprehensive sewerage throughout Los Angeles County was noted, but subsequent alterations and additions have diminished this historical association. Therefore, the Gardena Pumping Plant no longer retains integrity of association.

In summary, the subject property appears not eligible under all NRHP and CRHR designation criteria. Further, the Gardena Pumping Plant only retains integrity of location, and therefore does not maintain the requisite integrity to warrant listing in the NRHP or CRHR.

5.2 Majestic Lighting, 1923 West Artesia Boulevard (1957)

NRHP/CRHR Statement of Significance

In consideration of the project site's history and requisite integrity, 1923 West Artesia Boulevard is recommended not eligible for listing in the NRHP or CRHR based on the following significance evaluation.

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not identify any associations with events that have made a significant contribution to the broad patterns of local or regional history. Neither 1923 West Artesia Boulevard, nor its current tenant Majestic Lighting, is associated with any locally important events in the City of Gardena. Due to a lack of significant associations with events important to history, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

1923 West Artesia Boulevard is not a distinctive or remarkable example of the Mid-Century Modern architectural style. H.L. Standefer, the architect listed on the building plans, is not identified as a master architect. Further, the building does not possess high artistic value, and is not eligible as a contributor to a historic district. For all of these reasons, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that 1923 West Artesia Boulevard has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, 1923 West Artesia Boulevard is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: 1923 West Artesia Boulevard is sited on the original location of construction in its original orientation. Therefore, 1923 West Artesia Boulevard retains integrity of location.

Design: 1923 West Artesia Boulevard has not had significant, visible alterations over time that have compromised its integrity of design. It has not changed its layout, architectural style, or decoration since it was constructed in 1957. Therefore, 1923 West Artesia Boulevard retains integrity of design.

Setting: The setting of 1923 West Artesia Boulevard remains relatively unchanged since its construction in 1957. The north side of West Artesia Boulevard was populated between 1954 and 1960, and the size, massing, scale, and types of businesses have not changed in subsequent years. Therefore, 1923 West Artesia Boulevard retains integrity of setting.

Materials: 1923 West Artesia Boulevard has not had significant, visible exterior alterations over time that have compromised its integrity of materials. This is corroborated by the list of alterations on file with the City of Gardena's Community Development Department. Therefore, 1923 West Artesia Boulevard retains integrity of materials.

Workmanship: 1923 West Artesia Boulevard has not been altered on the exterior. Evidence of original workmanship, including the stone veneer decoration, are still present. Therefore, 1923 West Artesia Boulevard retains integrity of workmanship.

Feeling: 1923 West Artesia Boulevard retains integrity and still successfully conveys the feeling of being a 1950s Mid-Century Modern small-scale commercial building, and has not experienced significant alterations that would significantly impact the building's ability to convey this feeling. Therefore, the 1923 West Artesia Boulevard retains integrity of feeling.

Association: No important historical associations with events or people were identified for the subject property.

In summary, 1923 West Artesia Boulevard retains integrity, including integrity of location, design, setting, materials, workmanship, and feeling. However, the subject property appears not eligible under all NRHP and CRHR designation criteria for lack of important associations and lack of distinctive characteristics of a style or a master architect.

5.3 E-S Technical Motorsports, 1931 West Artesia Boulevard (1954)

NRHP/CRHR Statement of Significance

In consideration of the project site's history and requisite integrity, 1931 West Artesia Boulevard is recommended not eligible for listing in the NRHP or CRHR based on the following significance evaluation.

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not identify any associations with events that have made a significant contribution to the broad patterns of local or regional history. Neither 1931 West Artesia Boulevard, its current tenant E-S

Technical Motorsports, nor previous tenants are associated with any locally important events in the City of Gardena. Due to a lack of significant associations with events important to history, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The building at 1931 West Artesia Boulevard is not a distinctive or remarkable example of the Mid-Century Modern architectural style. The building also does not have an identified architect or a master architect. Further, the building does not possess high artistic value, and is not eligible as a contributor to a historic district. For all of these reasons, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that 1931 West Artesia Boulevard has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, 1931 West Artesia Boulevard is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: 1931 West Artesia Boulevard is sited on the original location of construction in its original orientation. Therefore, 1931 West Artesia Boulevard retains integrity of location.

Design: 1931 West Artesia Boulevard has not had significant, visible alterations over time that have compromised its integrity of design. It has not changed its layout, architectural style, or decoration since it was constructed in 1954. Therefore, 1931 West Artesia Boulevard retains integrity of design.

Setting: The setting of 1931 West Artesia Boulevard remains relatively unchanged since its construction in 1954. The north side of West Artesia Boulevard, between Gramercy Place and the Dominguez Channel, was mostly agricultural land before becoming populated with small-scale commercial buildings between 1954 and 1960. The size, massing, scale, and types of businesses have not changed in subsequent years. Therefore, 1931 West Artesia Boulevard retains integrity of setting.

Materials: 1931 West Artesia Boulevard has not had significant, visible exterior alterations over time that have compromised its integrity of materials. This is corroborated by the list of alterations on file with the City of Gardena's Community Development Department. Therefore, 1931 West Artesia Boulevard retains integrity of materials.

Workmanship: 1931 West Artesia Boulevard has not been altered on the exterior. Therefore, 1931 West Artesia Boulevard retains integrity of workmanship.

Feeling: 1931 West Artesia Boulevard still successfully conveys the feeling of being a 1950s Mid-Century Modern small-scale commercial building, and has not experienced significant alterations that would significantly impact the building's ability to convey this feeling. Therefore, 1931 West Artesia Boulevard retains integrity of feeling.

Association: No important historical associations with events or people were identified for 1931 West Artesia Boulevard.

In summary, 1931 West Artesia Boulevard retains integrity, including integrity of location, design, setting, materials, workmanship, and feeling. However, the subject property appears not eligible under all NRHP and CRHR designation criteria for lack of important associations and lack of distinctive characteristics of a style or a master architect.

6 FINDINGS AND RECOMMENDATIONS

6.1 Summary of Findings

As a result of the background research, field survey, and property significance evaluations, the Gardena Pumping Plant, 1923 West Artesia Boulevard, and 1931 West Artesia Boulevard buildings appear not eligible for the NRHP or CRHR due to a lack of significant historical associations, architectural merit, and/or compromised integrity. Therefore, these properties are not considered historical resources for the purposes of CEQA.

No archaeological resources were identified within the project site as a result of the records search or NAHC Sacred Lands File search. Recommendations to reduce unanticipated impacts to archaeological resources and human remains during construction activities are provided below.

6.2 Management Recommendations

Unanticipated Discovery of Archaeological Resources

In the event that archaeological resources (sites, features, or artifacts) are exposed during construction activities for the proposed project, all construction work occurring within 100 feet of the find must immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards, can evaluate the significance of the find and determine whether or not additional study is warranted. Should it be required, temporary flagging may be installed around a resource to avoid any disturbances from construction equipment. Depending on the significance of the find under CEQA (14 California Code of Regulations Section 15064.5(f); PRC Section 21082), the archaeologist may record the find to appropriate standards (thereby addressing any data potential) and allow work to continue. If the archaeologist observes the discovery to be potentially significant under CEQA, additional treatment may be required.

Unanticipated Discovery of Human Remains

In accordance with California Health and Safety Code Section 7050.5, if potential human remains are found, the lead agency staff and the County Coroner must be immediately notified of the discovery. The coroner would provide a determination within 48 hours of notification. No further excavation or disturbance of the identified material, or any material reasonably suspected to overlie additional remains, can occur until a determination has been made. If the County Coroner determines that the remains are, or are believed to be, Native American, the coroner would notify the NAHC within 24 hours. In accordance with PRC Section 5097.98, the NAHC must immediately notify those persons it believes to be the MLD from the deceased Native American. Within 48 hours of this notification, the MLD would recommend to the lead agency the preferred treatment of the remains and associated grave goods.

APPENDIX A

Preparers' Qualifications

Kate Kaiser, MSHP

Architectural Historian

Kate Kaiser is an architectural historian with 7 years' professional experience as a cultural resource manager specializing in California Environmental Quality Act (CEQA) compliance, National Historic Preservation Act Section 106 compliance, reconnaissance and intensive level surveys, archival research, cultural landscapes, and GIS. Ms. Kaiser meets the Secretary of the Interior's Professional Qualification Standards for both architectural history and archaeology.

In addition, Ms. Kaiser has worked as an archaeological technician for the National Park Service and USDA Forest Service. She worked with federal, private, and local organizations to manage multidisciplinary transportation projects, park-wide inventories, and federal land management projects.

Development

Etiwanda Heights Neighborhood and Conservation Plan. Rancho Cucamonga, San Bernardino County, California. 2018. Kaiser served as architectural historian and co-author of the cultural resources technical report. For the Etiwanda Heights Neighborhood and Conservation Plan (EHNCP). Ms. Kaiser's report included conducting a record search, coordinating with the San Bernarino County Department of Public Works, developing the structure descriptions, archival research, historical context development, and historical significance evaluations. The project proposed to annex the project area from San Bernardino County into the City of rancho Cucamonga, and develop the Neighborhood Priority Area into a residential subdivision, and the Conservation Priority Area into a natural resource conservation area. Resources were determined to not meet the age threshold for listing in the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR).

Historical Resource Assessment for 1230 North Ogden Drive, City of West Hollywood, Los Angeles County, California. 2018. Ms Kaiser served as architectural historian and author of the historic resource assessment for four residential buildings on the 1230 North Ogden Drive parcel in West Hollywood. Ms. Kaiser's report included conducting a record search, coordinating with the City of West Hollywood for building permits, developing the building description, archival research, historical context development, historical significance evaluations, and California DPR form production for the four buildings. The historical resource assessment report fulfills City requirements during the development permit application process. All four buildings were determined inelgibile for listing in the NRHP or CRHR.

Oakmont/Tamarind Warehouse Project. City of Rialto, San Bernardino County, California. 2018. Ms. Kaiser served as architectural historian and co-author of the Cultural Resources Report for the Oakmont/Tamarind Warehouse Project. Ms. Kaiser contributed reconnaissance level fieldwork and aerial photograph descriptions for the report. The project proposed to construct a 156,500 sq. ft., one story warehouse on six adjoiing parcels on approximately 8 acres.

Healthcare

Kaiser Permanente Los Angeles Medical Center Project, Los Angeles, Los Angeles County, California. 2018. Ms. Kaiser served as architectural historian and co-author of the Draft EIR Cultural Resources Chapter and the author of the Cultural Resources Report Appendix. Preparation of the report involved extensive archival research, reconnaissance level fieldwork, historic context development, building development descriptions, historical significance evaluations, and DPR forms for six buildings greater than 45-years in age that are proposed for demolition as part of the multi-phase project. As a result of the evaluations, all buildings proposed for demolition were found not eligible for designation under all applicable national, state, and local designation criteria and integrity requirements. Ms. Kaiser's DEIR chapter also analyzed potential indirect impacts on two other National Register listed or eligible sites: the Aline Barnsdall Complex and the Hollywood Presbyterian Medical Center.

Municipal

LADWP Valley Generating Station Project, Los Angeles Department of Water and Power, California. 2019 (ongoing). Ms. Kaiser served as architectural historian and author of the Cultural Resources Technical Report for the Valley Generating Station Project. Preparation of the report involved site recordation, extensive archival research, historic context development, engineering feature development descriptions, historical significance evaluations, and State of California Department of Parks and Recreation Series 523 forms (DPR forms) for each building of the project. The project proposed to remove the 1953 steam generating plant, as well as the four stacks, SPRR rail spur, and underground fuel tanks.

Phillips 66 & Kinder Morgan Relocation Project, Berths 150-151, Marine Oil Terminal Engineering and Maintenance Standards (MOTEMS), Port of Los Angeles, California. 2019. Ms. Kaiser served as architectural historian and co-author of the Updated Historical Resources Evaluation Report for the Phillips 66 & Kinder Morgan Relocation Project. Preparation of the report involved reviewing previous evaluations for Union Oil Terminal Berths 150-151 and writing an updated significance evaluation. The project proposed to remove and replace the original wharfs with new concrete loading platform, mooring and breasting dolphins, access ramps, catwalks, and an underwater bulkhead. It also proposed the construction of new topside and piping components connecting the new platform to existing pipes in the backlands.

Gilroy City-wide Historic Resource Inventory, City of Gilroy, Santa Clara County, California. 2018 – ongoing. Ms. Kaiser served as architectural historian and co-author for the City-wide historic context statement prepared for the City of Gilroy. Preparation of the historical context statement involved extensive archival research, coordination with the City of Gilroy and archival repositories, chronological period and theme identification, and developing the historical narrative for the City.

Historic Context Statement for Reservoirs, City of San Diego Public Utilities Department, California. 2018 – ongoing. Ms. Kaiser served as architectural historian and author of the historic context statement, as well as individual historic resource reports for the Barrett Dam and reservoir, Lower Otay Dam and reservoir, and Hodges Dam and reservoir. Dudek is also preparing detailed impacts assessments for proposed modification to dams, as required by DSOD. The project involves evaluation of at least 10 dams for historical significance in consideration of NRHP, CRHR, and City designation criteria and integrity requirements, and requires extensive archival research and pedestrian survey. Upon completion of the project, the City will have a streamlined document for the management of their historic dam and reservoir infrastructure.

Globemaster Corridor Specific Plan, City of Long Beach, Los Angeles County, California. 2018. Ms. Kaiser served as architectural historian and author of the Draft EIR-EIS Cultural Resources Chapter for the Globemaster Corridor Specific Plan (GCSP) project. The project proposed to implement the GCSP, a planning and regulartory framework for redevelopment of an area adjacent to the Long Beach Airport and the surrounding residential and business

community which includes rezoning portions of the GCSP area, and a mobility plan that implements new streets and pedestrian connectors. Since the GCSP does not directly propose changes to the buildings or structures in the Plan area, the cultural resources report takes a programmatic overview and offers potential impacts analysis and mitigation measures for future development.

LADWP De Soto Tanks Project, Los Angeles Department of Water and Power, California. 2018. Ms. Kaiser served as architectural historian and author of the Historic Properties Identification Report for the De Soto Tanks EIR. Preparation of the report involved site recordation, extensive archival research, historic context development, engineering feature development descriptions, historical significance evaluations, and State of California Department of Parks and Recreation Series 523 forms (DPR forms) for each building of the project. The project proposed to remove the 1941 reservoir and associated buildings, and replace them with two modern underground storage tanks, as well as connections to the LADWP Rinaldi Trunk Line and De Soto Trunk Line.

LADWP Tujunga Spreading Grounds Enhancement, Los Angeles Department of Water and Power, California. 2018. Ms. Kaiser served as architectural historian and author of the cultural resources report CEQA-Plus Project. Preparation of the report involved site recordation, extensive archival research, historic context development, engineering feature development descriptions, historical significance evaluations, and State of California Department of Parks and Recreation Series 523 forms (DPR forms) for each building of the project. The evaluation found the property ineligible under all NRHP, CRHR, and Los Angeles Historic-Cultural Monuments designation criteria. The project proposed to modify a U.S. Army Corps of Engineer-owned flood control channel to divert more flood water from the Tujunga Flood Control Channel into the Tujunga Spreading Grounds.

LADWP West Los Angeles District Yard Project, Los Angeles Department of Water and Power, California. 2017. Ms. Kaiser served as architectural historian and author of the cultural resources report. Preparation of the report involved extensive archival research, in-field research, historic context development, building development descriptions, historical significance evaluations, and DPR forms for each building of the project. The evaluation found the property ineligible under all National Register of Historic Places, California Register of Historic Resources, and Los Angeles Historic-Cultural Monuments designation criteria. The project proposed to demolish existing buildings and build new buildings and an underground parking structure.

Santa Monica City Yards Master Plan Project, City of Santa Monica, Los Angeles County, California. 2017. Ms. Kaiser served as architectural historian and co-author of the historical resource evaluation report. Preparation of the report involved extensive archival research, in-field research, historic context development, building development descriptions, historical significance evaluations, and DPR forms for each building of the project. The City of Santa Monica retained Dudek to complete a cultural resources study for the proposed City Yards Master Plan project site located at 2500 Michigan Avenue in the City of Santa Monica.

State of California

Judicial Council of California Historical Resource Evaluation Report for the Stanley Mosk Courthouse, City of Los Angeles, Los Angeles County, California. 2019 (ongoing). Ms. Kaiser served as architectural historian and author of the historical resource evaluation report. Preparation of the report involved extensive archival research, interior and exterior survey fieldwork, historic context development, material descriptions, historical significance evaluations, and DPR forms for the Stanley Mosk Courthouse. Dudek was retained by the Judicial Council of California (JCC) to comply with Public Resources Code Section 5024(b), the JCC must submit to the State Historic Preservation Officer (SHPO) an inventory of all structures over 50 years of age under the JCC's jurisdiction that are listed in or that may be eligible for inclusion in the National Register of Historic Places (NRHP), or registered or that may be eligible for registration as a California Historical Landmark (CHL). The Stanley Mosk Courthouse was found eligible for designation for the NRHP, CHL, CRHR, and Los Angeles Historic Cultural Monument list under Criterion A/1 and C/3.

Linda Kry

Archaeologist

Linda Kry is an archaeologist with 12 years experience in cultural resource management specializing in various aspects of cultural resources investigations. Ms. Kry's experience includes archival research, reconnaissance surveys, archaeological excavations, artifact analysis, and authoring technical reports pursuant to the California Environmental Quality Act and Section 106 of the National Historic Preservation Act.

Education

University of California, Los Angeles
BA, Anthropology, 2006
Cerritos College
AA, Anthropology, 2004

Project Experience

San Jacinto II Wind Energy Repowering Project, Terra-Gen, LLC, Palm Springs, California. The project involves the decommissioning of approximately 126 existing wind turbines and the construction and operation of up to seven new wind turbines on private lands under the jurisdiction of the City of Palm Springs and on federal lands administered by the Bureau of Land Management. Responsibilities as technical lead include the management of a Phase I cultural resources study in compliance with the provisions of local regulations, CEQA, and Section 106 of the National Historic Preservation Act of 1966. (December 2018–Present)

Kaiser Permanente Moreno Valley Medical Center Master Plan, Kaiser Permanente, Moreno Valley, California. Kaiser Permanente is proposing the development of an approximately 400-bed hospital, hospital support buildings, outpatient medical office buildings, a central utility plant, and surface and structured parking within their existing hospital campus through a three-phase plan. The City of Moreno Valley is the lead agency under CEQA. As the technical lead for the project, responsibilities include the management of a Phase I cultural resources study. (November 2018–Present)

City of Colton Modern Pacific 88-DU Residential Project, City of Colton, Colton, California. Technical lead for a Phase I cultural resources study and Extended Phase I subsurface probing effort in accordance with CEQA. The City of Colton is proposing the development of 89-detatched single-family homes on an approximately 41.58-acre site within a single tract. (November 2018–Present)

Protea Memory Care Facility Project, City of San Juan Capistrano, San Juan Capistrano, California. Technical lead for a Phase I cultural resources study in accordance with CEQA and subject to California Assembly Bill 52 and Senate Bill 18, in support of a project that proposes to construct a 59-unit (72-bed) memory care facility. (September 2018–November 2018)

Coronado Trunk Line Project, Los Angeles Department of Water and Power, Los Angeles, California. Technical lead for a Phase I cultural resources study pursuant to CEQA and Section 106. Los Angeles Department of Water and Power is proposing to construct a new 30-inch diameter welded steel pipe, approximately 7,200 feet in length, along with a regulating and relief station vault and flow master vault. The proposed trunk line would add reliability and redundancy to the system. (September 2018–October 2018)

River Supply Conduit Unit 7 Project, Los Angeles Department of Water and Power, Los Angeles and Burbank, California. Technical lead and monitoring coordinator for the River Supply Conduit (RSC) Unit 7 Project. The

existing River Supply Conduit (RSC) is a major transmission pipeline in the LADWP water distribution system. The Project is critical to meet safety of water supplies, reliability of water infrastructure, and sustainability of water supply. (August 2018–Present)

Sand Canyon Resort, City of Santa Clarita, Santa Clarita, California. Served as technical lead for a cultural resources study for a project that proposes to develop an abandoned, approximately 75-acre existing open space into a new resort and spa in an effort to become the premiere golf destination in northern Los Angeles County. Tasks include management of the technical study including the archival research, pedestrian survey, and reporting of the study results. Additionally, authored the Cultural and Tribal Cultural Resources chapters for the Environmental Impact Report (August 2018–December 2018)

Creek at Dominguez Hills, Plentitude Holdings LLC, Carson, California. Served as contributing author for the environmental impact report for a development project that consists of approximately 532,500 square feet of buildings, including: a multiuse indoor sports complex; youth learning experience facility; indoor skydiving facility; public golf recreation facility; marketplace; clubhouse; recreation and dining center; a sports wellness center; and restaurants. Alternatively, a specialty grocery store may be developed in place of some of the restaurant uses. (August 2018–December 2018)

Relevant Previous Experience

Amapa Archaeology Project, Amapa, Oaxaca, Mexico. Served as excavator and lab analyst for an archaeological academic research project in the town of Amapa, located in the Mexican state of Oaxaca. Amapa was founded in 1769 by black runaway slaves, who fled sugar plantation slavery in central Veracruz. Using a 1770 plan map and colonial documents, the project focused on excavations around an 18th century church where shallow colonial period deposits were previously encountered in 2017. The fieldwork was conducted in an effort to address research questions regarding the town's use of architecture and space, and whether the evidence is accurately reflected in the 1770 map. (June–July 2018)

Los Angeles International Airport (LAX) Midfield Satellite Concourse, Los Angeles, California. Served as field director for archaeological and paleontological monitoring project associated with the creation of a new aircraft passenger concourse and associated elements at LAX. Responsibilities included coordinating with company personnel and project contractors, scheduling, and recordation and collection of field data. (April 2017–December 2017)

Los Angeles Metropolitan Transportation Authority Compliance Monitoring, Los Angeles, California. Served as archaeological and paleontological monitor for the multiyear and multisite project within the greater Los Angeles area, including the Crenshaw rail transit corridor and the 1.9-mile Regional Connector subway corridor, as well as their associated stations. In addition, served as monitoring coordinator for the Regional Connector Archaeological and Paleontological Monitoring Project. Responsibilities as Monitoring Coordinator included coordinating and scheduling various contractors and archaeologists; developing and providing cultural resources training for new contractors and archaeologists; monthly project updates to client; invoice and budget reviews; lab analysis of all resources collected and preparation of those resources for curation. (April 2013–January 2018)

Los Angeles Department of Water and Power Division Creek, Inyo County, California. Served as deputy project manager providing consultation and support in U.S. Forest Service and Bureau of Land Management consultation for the assessment of historical structures associated with the Division Creek Power Plant and Los Angeles Aqueduct. Responsibilities included assisting with work plans, project permitting, budgeting, and reporting. In addition, served as crew chief for archaeological surveys and testing. Conducted lab analysis of artifacts,

prepared these resources for curation, and co-authored reports on the results of all findings. (July 2013–November 2017)

Genesis Solar Energy Project, Blythe, California. Served as archaeological monitor. Monitored the placement of transmission lines, large-scale excavations for the placement of solar panels, and caisson drilling for solar panel footings. Responsibilities also included survey, testing, and artifact collection. Coordinated with the client, archaeologists, Native American monitors, and general contractors. Provided daily updates, reviewed daily archaeological monitoring logs, and collected/stored resources daily. (June 2011–February 2014)

Long Beach Courthouse, City of Long Beach, Long Beach, California. Served as lead archaeological and paleontological monitor during construction of a new courthouse. Duties included providing workers training regarding archaeological and paleontological resources for on-site contractors, documenting historical archaeological features, and coordinating with clients and staff. In addition, conducted excavations of early 20th century features discovered during monitoring. Also served as lab director for the analysis, cataloging and processing artifacts for curation. Co-authored report documenting project results. (2010–2011)

Topanga Library, Topanga Canyon, California. Served as crew chief. Involved in multiple facets of archaeological research. Conducted archaeological monitoring during construction of the Topanga Library, which resulted in the discovery of materials associated with a pre-colonial Gabrielino site. Identified and processed cultural and human remains, as well as contributed to report on all findings. (2009–2010)

Solar Millennium Blythe Project, Blythe, California. Served as crew chief for archaeological survey of a proposed solar electric facility in the Chuckwalla Valley. Project included survey of the project site and buffer zones, recordation of historical and pre-colonial archaeological sites, and documentation on Department of Parks and Recreation Forms. (June 2009–March 2010)

Central Los Angeles High School #9, Los Angeles Unified School District, Los Angeles, California. Served as excavator and lab analyst. Duties included assessing artifact conditions and conservation needs, assisting with development and implementation of artifact cleaning procedures, artifact classification, artifact cataloging using Excel, and the reconstruction of artifacts. Over 3,000 historic-era artifacts were recovered from a 19th-century cemetery. (2006–2009)

Beacon Solar Energy Project, Los Angeles Department of Water & Power, Kern County, California. Archaeological monitoring for the Beacon Solar Energy Project. Monitored excavation for the placement of solar panels. Aspects of the project included monitoring, survey, testing, and artifact collection. Responsibilities included recordation and collection of cultural resources discovered during monitoring and scheduling with Native American and construction crews.

Oasis Solar Field, NRG Solar, Environmental Assessment for the City of Palmdale and the United States Air Force, Palmdale, California. Served as Crew Chief for an archaeological survey. Responsibilities include data collection for historical resources and recordation of field data on Department of Parks and Recreation Forms.

California High Speed Train Project, Fresno, Madera, and Merced Counties, California. Field Archaeologist. Assisted in archaeological survey of parcels for a proposed high-speed train in Central California. The project included an archaeological survey of the project areas of potential effect and buffer zones, the recordation of historic and prehistoric archaeological resources, and recordation of field data on Department of Parks and Recreation Forms.

Samantha Murray, MA

Historic Built Environment Lead / Senior Architectural Historian

Samantha Murray is a senior architectural historian with 13 years' professional experience in in all elements of cultural resources management, including project management, intensive-level field investigations, architectural history studies, and historical significance evaluations in consideration of the California Register of Historical Resources (CRHR), the National Register of Historic Places (NRHP), and local-level evaluation criteria. She meets the Secretary of the Interior's Professional Qualification Standards for both Architectural History and Archaeology.

Education

California State University, Los Angeles
MA, Anthropology, 2013

California State University, Northridge
BA, Anthropology, 2003

Professional Affiliations

California Preservation Foundation

Society of Architectural Historians

National Trust for Historic Preservation

Registered Professional Archaeologist

Ms. Murray is skilled in the recordation, evaluation, and mitigation of adverse effects to historic water resource infrastructure throughout California, including dams, reservoirs, pumping stations, channels, and culverts. Understanding the scale and complexity of this unique resource type, Ms. Murray has guided architects and engineers through the process of adjusting plans to conform with the Secretary of the Interior's Standards for Rehabilitation, and understands the need to strike a balance between preservation and functionality. In addition to her expertise with water resource infrastructure, she has prepared hundreds of historical resource evaluations and developed detailed historic context statements for a multitude of property types and architectural styles, including private residential, commercial, industrial, educational, medical, ranching, mining, airport, and cemetery properties. Ms. Murray also has a strong understanding of consultation with the State Historic Preservation Officer (SHPO), and regularly receives SHPO concurrence with no comments. She has also provided expertise on numerous projects requiring conformance with the *Secretary of the Interior's Standards for the Treatment of Historic Properties*.

Finally, Ms. Murray has extensive experience preparing environmental compliance documentation in support of projects that fall under the California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA), and Sections 106 and 110 of the National Historic Preservation Act (NHPA). She also regularly works with local governments and historic preservation ordinance requirements. Ms. Murray has also served as a third-party reviewer and expert witness in court proceedings concerning interpretation and treatment of historical resources under CEQA and local municipal code.

Select Water Infrastructure Project Experience

San Diego PUD Citywide Historic Context Statement and Evaluation of Dam Infrastructure (in progress). Dudek is currently in the process of preparing a citywide historic context statement and significance evaluation of all dam and reservoir infrastructure owned/operated by the City's Public Utilities Department. Dudek is also preparing detailed impacts assessments for proposed modification to dams, as required by DSOD. The project involves evaluation of at least 10 dams for historical significance in consideration of NRHP, CRHR, and City designation criteria and integrity requirements, and requires extensive archival research and pedestrian survey. Upon completion of the project, the City will have a streamlined document for the management of their historic dam

and reservoir infrastructure. To date, Dudek has completed a draft historic context statement and three dam historical significance evaluations.

City of Santa Cruz Newell Creek Dam Inlet Outlet Replacement Project (in progress). Dudek is currently working with the City of Santa Cruz. The Newell Creek Dam is an earthen dam approximately 195 feet high with a crest length of about 750 feet. Built in 1961, the dam forms Loch Lomond Reservoir (Reservoir), which has a maximum storage capacity of approximately 8,646 acre-feet. The City owns the reservoir, and the Santa Cruz Water Department operates it as the primary storage facility for the City's water supply system. The proposed Project would consists of replacement of the existing aging inlet/outlet works in new locations at the Reservoir and other associated improvements. Dudek completed an historical resource evaluation of the dam and associated infrastructure in consideration of NRHP, CRHR, and City designation criteria and integrity requirements and prepare a detailed impacts assessment. The draft report is currently being reviewed by the City.

LADWP Tujunga Spreading Grounds Enhancement Project, City of Los Angeles, Los Angeles County, California (2018). Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes to install two new intake facilities to capture high flows from the Tujunga Flood Control and Pacoima Channels. After thorough consideration of NRHP, CRHR, and City of Los Angeles Historic-cultural Monument (HCM) designation criteria, the Tujunga Flood Control Channel segment addressed in this project does not appear eligible under any designation criteria. Ms. Murray co-authored the significance evaluation and provided QA/QC of the cultural resources report.

LADWP Green Verdugo Reservoir Improvement Project, City of Los Angeles, Los Angeles County, California (2017). Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes facility updates at the reservoir site in order to ensure safe water quality. Ms. Murray evaluated the reservoir for historical significance in consideration of NRHP, CRHR, and City of Los Angeles HCM designation criteria and integrity requirements, and co-authored the cultural resources report.

Tequesquite Creek Maintenance Project, City of Riverside, Riverside County, California (2017). Dudek was retained by the City of Riverside to conduct a cultural resources study for the proposed Tequesquite Creek Maintenance Project. The Tequesquite Creek Channel was constructed circa 1962-1966 and required evaluation for historical significance. The resource was found ineligible under all designation criteria and integrity requirements. Ms. Murray co-authored the significance evaluation and provided QA/QC of the cultural resources report.

LADWP Upper Stone Canyon Reservoir Water Quality Improvement Project, City of Los Angeles, Los Angeles County, California (2016). Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes to maintain and improve the quality, reliability, and stability of the Stone Canyon Reservoir Complex (SCRC) service area drinking water supply in order to continue to meet customer demand. Dudek prepared an updated evaluation of the reservoir in consideration of NRHP, CRHR, and City of Los Angeles HCM criteria and integrity requirements. Ms. Murray conducted the built environment survey, archival research, and co-authored the cultural resources report.

LADWP North Hollywood West Well Field Water Treatment Project, City of Los Angeles, Los Angeles County, California (2016). Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes to implement a response action to address releases of 1,4 dioxane in groundwater that are migrating to the NHW Well Field. This response action would be achieved by installing treatment equipment at the well field capable of removing 1,4-dioxane to below the identified cleanup levels. Ms. Murray provided QA/QC of the cultural resources technical report.

69th and Mohawk Pump Station Project, City of San Diego, California (2015). Ms. Murray served as architectural historian and lead author of the Historical Resource Technical Report for the pump station building on 69th and Mohawk Street. Preparation of the report involves conducting extensive building development and archival research on the pump station building, development of a historic context, and a historical significance evaluation in consideration of local, state, and national designation criteria and integrity requirements.

Pump Station No. 2 Power Reliability and Surge Protection Project, City of San Diego, California (2015). Ms. Murray served as architectural historian and prepared an addendum to the existing cultural resources report in order to evaluate the Pump Station No. 2 property for NRHP, CRHR, and local level eligibility and integrity requirements. This entailed conducting additional background research, building development research, a supplemental survey, and preparation of a historic context statement.

Bear River Restoration at Rollins Reservoir Project, Nevada Irrigation District, Nevada and Placer Counties, California (2014). Ms. Murray served as architectural historian and co-author of the Cultural Resources Inventory Report. Ms. Murray conducted background research on the 1963 Chicago Park Powerhouse Bridge and prepared a historic context for the Little York Township and Secret Town Mine.

Expert Witness

Robert Salamone vs. The City of Whittier (2016). Ms. Murray was retained by the City of Whittier to serve as an expert witness for the defense. She peer reviewed a historic resource evaluation prepared by another consultant and provided expert testimony regarding the contents and findings of that report as well as historic resource requirements on a local and state level in consideration of the City of Whittier's Municipal Code Section 18.84 and CEQA. Judgement was awarded in favor of the City.

Peer Review

Peer Review of 1106 North Branciforte Avenue, City of Santa Cruz, Santa Cruz County, California (2017). Dudek was retained by the City of Santa Cruz to peer review the revised Department of Parks and Recreation Series 523 forms (DPR forms) for the property located at 1106 North Branciforte Avenue in the City of Santa Cruz. Ms. Murray conducted two rounds of peer review on the original and revised evaluation.

Peer Review of Avenidas Expansion Project, City of Palo Alto, Santa Clara County, California (2016). Ms. Murray peer reviewed a historical resource evaluation report for the property at 450 Bryant Street. The peer review assessed the report's adequacy as an evaluation in consideration of state and local eligibility criteria and assessed the project's conformance with the Secretary of the Interior's Standards for Rehabilitation.

Peer Review of 429 University Avenue Historic Resources Evaluation Report, City of Palo Alto, Santa Clara County California (2014). Ms. Murray conducted a peer review of a study prepared by another consultant, and provided a memorandum summarizing the review, comments, and recommendations, and is currently working on additional building studies for the City of Palo Alto.

Peer Review of 1050 Page Mill Road Historic Resources Evaluation Report, City of Palo Alto, Santa Clara County, California (2014). Ms. Murray conducted a peer review of a study prepared by another consultant, and provided a memorandum summarizing the review, comments, and recommendations.

Presentations

***Historical Resources under CEQA*. Prepared for the Orange County Historic Preservation Planner Working Group. Presented by Samantha Murray, Dudek. December 1, 2016.** Ms. Murray delivered a one-hour PowerPoint presentation to the Orange County Historic Preservation Planner Working Group, which included

planners from different municipalities in Orange County, regarding the treatment of historical resources under CEQA. Topics of discussion included identification of historical resources, assessing impacts, avoiding or mitigating impacts, overcoming the challenges associated with impacts to historical resources, and developing effective preservation alternatives.

***Knowing What You're Asking For: Evaluation of Historic Resources*. Prepared for Lorman Education Services. Presented by Samantha Murray and Stephanie Standerfer, Dudek. September 19, 2014.** Ms. Murray and Ms. Standerfer delivered a one-hour PowerPoint presentation to paying workshop attendees from various cities and counties in Southern California. The workshop focused on outlining the basics of historical resources under CEQA, and delved into issues/challenges frequently encountered on preservation projects.

Erica Nicolay, MA

Cultural Resource Specialist

Erica Nicolay is an cultural resource specialist with 3 years' experience as an archaeologist, primarily in Southern California. Ms. Nicolay has worked on projects for private developers, municipalities, government agencies, and energy companies. She has experience determining cultural resource sensitity for proposed projects, developing project-specific mitigation measures, communicating with interested parties, and/or conducting fieldwork in order to assess known resources or determine if unknown resources could be present.

Education

Relevant Project Experience

Development

Cultural Resource Assessment for the Compton High School Replacement Project, Compton California. (3 Weeks) Co-authored cultural resource assessment report for the proposed Compton High School Replacement Project. The purpose of this assessment was to determine the sensitivity of the project area and to determine the likelihood that archaeological resources would be impacted by the proposed construction. Tasks comprised conducting historical research, including analyzing historical aerials, historical topographic maps, and ethnographic literature; initiating and tracking a Native American outreach program; and conducting a search of the California Historical Resources Information System (CHRIS).

222 West Second Street Tribal Cultural Resource Assessment, Los Angeles, California. (3 weeks) Co-authored a tribal cultural resource assessment for 222 West Second Street. The purpose of this assessment was to determine the likelihood of encountering historic or prehistoric tribal cultural resources during the proposed construction. Tasks included analyzing historical aerials, maps and ethnographic resources, and conducting a CHRIS search.

Resource Management

Archaeological Testing and Data Recovery Project, Malibu, California. (6 weeks) Served as a co-field director for an archaeological testing program and subsequent data recovery project at a prehistoric site in Malibu. The purpose of the project was to assess the state of the site, determine if there were intact features present in the proposed footprint of construction for a new gas line, and efficiently and appropriately document and remove any uncovered features. Tasks included supervising a crew of eight archaeologists, coordinating with construction crews, tracking excavation progress and findings, conducting excavation, and creating to-scale plan-view maps of all features.

Updated Cultural Resource Survey for the Travertine Land Development, La Quinta, California. (3 weeks) Served as survey leader on private and Bureau of Land Management land in La Quinta for the proposed Travertine Land Development Proposal. The purpose of the survey was to revisit sites that had previously been located and determine if they were within or outside of the proposed project's area of potential effects. Tasks include relocating and assessing the state of previously recorded sites, preparing updated site forms, and coauthoring the final survey report.

APN: 4094-007-903; The Gardena Pumping Plant is located in the southern portion of the City of Gardena, adjacent to the City of Torrance border. Gardena is in the South Bay region of Los Angeles County, between the Cities of Torrance and Carson. Generally, the Project site is located northwest of the Interstate (I-) 405 and State Route (SR-) 110 intersection and west of the Dominguez Channel. The building is located on a 50 foot-by-75 foot lot fronting on West Artesia Boulevard, among several small-scale automotive and industrial buildings.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Gardena Pumping Plant is a one-story, brick pumping plant located in the southwest portion of the City of Gardena. The building has a rectangular plan, with a smaller rectangular addition on its west side, and a flat roof with parapet. The pumping plant resembles the brick commercial-style building seem most commonly in commercial architecture, despite its use as a public utility building. It also has some secondary (See Continuation Sheet)

P3a Description (Continued): Neo-Classical influenced decoration, including common (American) bond brickwork, a decorative header belt course and dentil band below the parapet, an arched entry on the 1928 building, and a basket-weave section of decorative brickwork on the front elevation flanking the door. On the 1960 addition, the header belt course is repeated, but the other decorative elements are lost: the brick bond is stretcher-only, suggesting it is a brick façade over a brick building; the double door only has a flat arch soldier course, and there are no flanking decorative brickwork as with the basket-weave on the 1928 building.

The main (south) elevation faces West Artesia Boulevard. The south elevation has two clearly defined halves, the 1960 addition (left) and the 1928 original building (right). Both are symmetrically arranged with metal double door in the center of the elevation. The left building (1960) has no other decoration, other than a soldier course flat arch over the door and a belt course below the parapet. The left building brickwork is stretcher bond only, and a lighter colored, raked orange brick than its 1928 neighbor. There is a small gap between buildings, however, this gap is only cosmetic and the buildings clearly share a wall on the interior. The right building (1928) is symmetrical, with two basket-weave brickwork sections flanking the centered double door with an arch, and a belt and dentil course below the parapet. The belt and dentil course is present on all visible elevations of the 1928 building (south, east, north, and visible portion of west). This elevation features common bond, raked, dark red-brown bricks in the 1928 building. The west elevation of the 1960 building features stretcher bond bricks, and continues the belt coursed below the parapet. It has two large, evenly spaced infilled windows with concrete sills, and soldier course flat arches above them. Continuing clockwise around the building the north (rear) elevation presents as two distinct halves. The left (1928) section protrudes roughly five feet further north than the right (1960) section. The left section has the common bond brickwork, as well as two infilled windows flanking a single metal door with a flat arch. The infilled window brickwork clearly does not match the structural brickwork and appears to be a later repair. The right (1960) section also has two infilled windows flanking a single metal door, but like its main elevation it features stretcher bond bricks and a belt course for its only decoration. The north elevation also has several objects attached to the building exterior, including gutters scuppers for the roof at the parapet line, lights, pipes, utility boxes and an exhaust fan. Finally, the east elevation is only visible for the 1928 building. This elevation features common bond bricks with two infilled windows with concrete sill and flat arch still visible. There is also a single, 12-brick basket-weave pattern in a diamond orientation centered between the two windows.

There are several other structural elements to the Gardena Pumping Plant. Because it is connected to the sewer system, there is an extensive below-ground component consisting of a wet well near the front portion of the lot and two dry wells, one under each building, extending 26 feet below the ground level. Access to the dry wells are through the interior. The dry wells structures are board-formed concrete in the 1928 building and plywood formed concrete in the 1960 addition. Access to the wet well is through a cement collar and pressed aluminum metal hatch at the ground level, directly in front of (south) the west portion (1960) of the building. There are several such access points to the wet well on the paved section of lot in front of the building.

B6. Construction History (Continued):

According to LACSD records, A.M. Rawn approved the original Gardena Pumping Plant (pumping plant No. 1) in February 1928, though the original designer is unknown. The original pumping plant was designed by county engineers and approved by A.M. Rawn, Assistant Chief Engineer, and A.K. Warren, Chief Engineer. The original designers were not named on the engineering plans (LACSD 1928).

There are two major and several minor alterations to the Gardena Pumping Plant. The most

notable of these is the 1960 addition of a second pumping plant, and a 1971-1972 project to update the plant. In 1960, a second pumping plant was deemed necessary to accommodate the growing demands on the 1928 pumping plant. This alterations included the addition of a below ground wet and dry well, an above-ground building, constructed of brick that shared the west wall of the 1928 pumping plant building, and would house two pumps, and electrical equipment sufficient to automate the plant. Contractors involved included Domar Electric, Barney's Drilling Service, Pacific Crane and Rigging, Blue Diamond Steelmen, Asher's Concrete Cutting Co., Rosencrans Construction Co, and Midway Construction Co. LACSD employees completed the remainder of the construction work. Construction of the 1960 pumping plant began on May 31, 1960 and concluded on December 9, 1960 (LACSD 1960; Permit E3995; Permit B6518).

In 1972, another major construction project took place at the Gardena Pumping Plant. This involved repaving the blacktop on the lot, installing new electrical transformers; replace existing electrical conduit into building and dry well; installing a new diesel generator; installing control panels; demolishing the 1928 wet well; creating a new wet well; and removing and replacing the 1928 building main elevation door. Contractors included Jenkin Construction Company, Ashcraft Electric, Barney's Drilling Service, Signal Steel Co., L.A. Door Repair Corp, Amex Paving, and Superior Coatings Paint. Construction of the 1972 alterations began on June 21, 1971, and concluded on October 5, 1972 (LACSD 1972; Permit B15884).

During the course of survey, there was one observed alteration. Between 1972 and present, all of the windows on the west, north and east elevations were infilled with brick. These alterations were not included on any of the permits, plans, or narrative descriptions of other alterations.

B10. Significance (Continued):

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research identified that the original 1928 Gardena Pumping Plant was likely designed and built during the initial LACSD campaign to build out the Sanitation District No. 5 infrastructure including sewer trunk lines, branch lines, wells, and other pumping stations. District No. 5 was built concurrently with Districts 1, 2, 3, 4, and 8. This was part of a County-wide push for sanitation infrastructure in the early twentieth century, to not only accommodate population growth in the proposed sanitation districts, but to promote or entice industrial development to establish in Los Angeles County. However, the role of the Gardena Pumping Plant in this campaign is trivial. The subject pumping plant was one of several plants working as part of a larger infrastructure system to keep sewage moving to the outfall plant at White's Point. Moreover, the building has undergone several alterations and a large addition from 1960, that has diminished its integrity and its ability to convey an association with the 1925-1930 Sanitation District infrastructure project. Therefore, the Gardena Pumping Plant does not appear eligible under NRHP/CRHR Criteria A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, the Gardena Pump Plant does not appear eligible under NRHP/CRHR Criteria B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Gardena Pumping Plant is not a distinctive or remarkable example of the early twentieth century

commercial style and has had several major alterations including new doors, window infill, and a 1960 addition clearly visible from the main elevation. It retains some minor character defining features such as the decorative basket-weave brickwork on the 1928 building, and the belt course and dentil band below the parapet. An LACSD engineer designed the Gardena Pumping Plant, but the name of the designer could not be determined from the engineering plans. The building does not possess high artistic value and is not a significant or distinguishable entity whose components lack individual distinction. For all of these reasons, the Gardena Pumping Plant does not appear eligible under NRHP/CRHR Criteria C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that Gardena Pumping Plant has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, the Gardena Pumping Plant is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: Gardena Pumping Plant is sited on the original location of construction in its original orientation. Therefore, Gardena Pumping Plant retains integrity of location.

Design: Gardena Pumping Plant was subjected to several extensive exterior alterations over time that compromise its integrity of design, including a 1960 addition visible from the main elevation, rendered in a different style, window infill on the west, north, and east elevations, a new door, and arched entry infill for the 1928 building. Therefore, the Gardena Pumping Plant does not retain integrity of design.

Setting: The setting of the Gardena Pumping Plant has changed significantly since the original 1928 building was built, including the slow replacement of orchards and agricultural fields with small-scale industrial and commercial buildings, complete urbanization of the Gardena Valley area. Therefore, Gardena Pumping Plant does not retain integrity of setting.

Materials: Numerous alterations to the Gardena Pumping Plant have compromised the property's material integrity, including a 1960 addition, window infill, and new doors. Even though brick material was used for the 1960 addition window infill, there has been material loss of all original fenestration. Therefore, Gardena Pumping Plant no longer retains integrity of materials.

Workmanship: Similar to the issue with materials, the physical evidence of a craftsman's skills in constructing the original Gardena Pumping Plant building was compromised by the alterations and additions. Therefore, the Gardena Pumping Plant no longer retains its integrity of workmanship.

Feeling: The Gardena Pumping Plant does not convey the feeling of an early twentieth century utility building, since subsequent alterations and additions negatively affected the buildings' ability to convey this feeling. Therefore, the Gardena Pumping Plant no longer retains integrity of feeling.

Association: An important historical associations between the Gardena Pumping Plant and early Los Angeles County efforts to introduce comprehensive sewerage throughout Los Angeles County was observed, however, subsequent alterations and additions have diminished this historical association. Therefore, the Gardena Pumping Plant no longer retains integrity of association.

In summary, the subject property appears not eligible under all NRHP and CRHR designation criteria. Further, the Gardena Pumping Plant only retains integrity of location, and therefore

does not maintain the requisite integrity to warrant listing in the NRHP or CRHR.

P3a Description (Continued):

bowstring truss system. Exterior wall cladding on the main elevations features mostly smooth yellow-painted concrete with applied stone veneer around the entrance. Several electric lights are affixed to the main elevation. From left to right, fenestration on the main elevation consists of a multi-lite window in metal frame, a glass double door with glass side-lite, and a gated garage door at the far right side. The only other accessible elevation was the east elevation, which was a painted concrete masonry unit (CMU) wall with no decoration or fenestration. The roof system features a rounded, bowstring truss system. The building is set back against the rear portion of the lot, facilitating parking in the paved front of the lot. Near the public right-of-way portion of the lot is the majestic lighting sign, rendered yellow and in the shape of a crown with an "M" on it.

B10. Significance (Continued):

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not identify any associations with events that have made a significant contribution to the broad patterns of local or regional history. Neither 1923 West Artesia Boulevard, nor its current tenant Majestic Lighting, are associated with any locally important events in the City of Gardena. Due to a lack of significant associations with events important to history, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

1923 West Artesia Boulevard is not a distinctive or remarkable example of the Mid-Century Modern architectural style. H.L. Standefer, the architect listed on the building plans is not identified as a master architect. Further, the building does not possess high artistic value, and is not eligible as a contributor to an historic district. For all of these reasons, 1923 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that 1923 West Artesia Boulevard has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, 1923 West Artesia Boulevard is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: 1923 West Artesia Boulevard is sited on the original location of construction in its original orientation. Therefore, 1923 West Artesia Boulevard retains integrity of location.

Design: 1923 West Artesia Boulevard has not had significant, visible alterations over time that have compromised its integrity of design. It has not changed its layout, architectural style, or decoration since it was constructed in 1957. Therefore, 1923 West Artesia Boulevard retains integrity of design.

Setting: The setting of 1923 West Artesia Boulevard remains relatively unchanged since its construction in 1957. The north side of West Artesia Boulevard was populated between 1954 and 1960, and the size, massing, scale and types of businesses have not changed in subsequent years. Therefore, 1923 West Artesia Boulevard retains integrity of setting.

Materials: 1923 West Artesia Boulevard has not had significant, visible exterior alterations over time that have compromised its integrity of materials. This is corroborated by the list of alterations on file with the City of Gardena's Community Development Department. Therefore, 1923 West Artesia Boulevard retains integrity of materials.

Workmanship: Similar to the issue with materials, the little physical evidence of workmanship in constructing 1517 North Vermont Avenue has not been altered on the exterior. Evidence of original workmanship, including the stone veneer decoration, are still present. Therefore, 1923 West Artesia Boulevard retains integrity of workmanship.

Feeling: 1923 West Artesia Boulevard retains integrity of still successfully conveys the feeling of being a 1950s Mid-Century Modern small-scale commercial building, and has not experienced significant alterations that would subsequent significantly impact the buildings' ability to convey this feeling. Therefore, the 1923 West Artesia Boulevard retains integrity of feeling.

Association: No important historical associations with events or people were identified for the subject property.

In summary, 1923 West Artesia Boulevard retains integrity of retains most of the aspects of integrity including integrity of location, design, setting, materials, workmanship, and feeling. However, the subject property appears not eligible under all NRHP and CRHR designation criteria for lack of important associations and lack of distinctive characteristics of a style or a master architect.

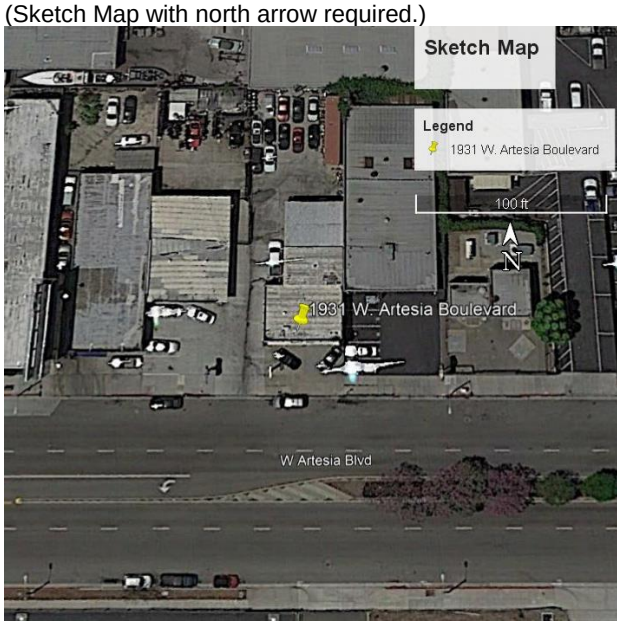
(Sketch Map with north arrow required.)



P3a Description (Continued): buildings, as well as the Gardena Pumping Plant. The building features a rectangular plan, with an addition on the north elevation. The roof system appears flat, with a high parapet wall on the front (south) elevation and side elevations. Exterior wall cladding on the main elevation features smooth white concrete, with red trim decoration, with brick trim at the bottom of the wall. A flat awning, trimmed with red, spans the elevation separating fenestration from signboard. Fenestration consists of two sets of metal framed, 2-lite display windows and two glass doors with a metal framed transom. Red-painted gutters and scuppers are visible on the front elevation, one at either end. The sign consists of a modern metal-framed, LED-lit sign. The entire lot and rear buildings were not visible during the course of survey. The visible portion of the east elevation cladding is red-painted CMU blocks with no fenestration. The visible portion of the west elevation is also red-painted CMU blocks with two one-over-one sash windows, covered with metal security bars. A portion of the east elevation of the rear addition was visible from the public right-of-way and it is red-painted CMU blocks with a white-painted metal roll-up garage door. No other elevations were visible or accessible during the survey. There is some space in the front lot for parking and a signpost, however, the signboard at the top is empty.

B6. Construction History (Continued):

Two alterations were determined from permits, on file at the City of Gardena Community Development Department: interior renovations in 2003 (Permit M0304-008, B0301-055) and permits to install forced air heating/cooling system (Permit M1912) in 2000. No other alterations were noted during the survey.

B10. Significance (Continued):

Criterion A/1: Associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not identify any associations with events that have made a significant contribution to the broad patterns of local or regional history. Neither 1931 West Artesia Boulevard, its current tenant E-S Technical Motorsports, nor previous tenants, are associated with any locally important events in the City of Gardena. Due to a lack of significant associations with events important to history, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria A/1.

Criterion B/2: Associated with the lives of persons significant in our past.

Archival research yielded no known associations with important figures in national, state, or local history. Therefore, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria B/2.

Criterion C/3: Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

1931 West Artesia Boulevard is not a distinctive or remarkable example of the Mid-Century Modern architectural style. The building also does not have an identified architect, let alone a master architect. Further, the building does not possess high artistic value, and is not eligible as a contributor to an historic district. For all of these reasons, 1931 West Artesia Boulevard does not appear eligible under NRHP/CRHR Criteria C/3.

Criterion D/4: Have yielded, or may be likely to yield, information important in prehistory or history.

There is no evidence to suggest that 1931 West Artesia Boulevard has the potential to yield information important to national, state, or local history, nor is it associated with a known archaeological resource. Therefore, 1931 West Artesia Boulevard is recommended not eligible under NRHP/CRHR Criterion D/4.

Integrity Discussion

Location: 1931 West Artesia Boulevard is sited on the original location of construction in its original orientation. Therefore, 1931 West Artesia Boulevard retains integrity of location.

Design: 1931 West Artesia Boulevard has not had significant, visible alterations over time that have compromised its integrity of design. It has not changed its layout, architectural style, or decoration since it was constructed in 1954. Therefore, 1931 West Artesia Boulevard retains integrity of design.

Setting: The setting of 1931 West Artesia Boulevard remains relatively unchanged since its construction in 1954. The north side of West Artesia Boulevard, between Gramercy Place and the Dominguez Channel, was mostly agricultural land before becoming populated with small-scale commercial buildings between 1954 and 1960. The size, massing, scale and types of businesses have not changed in subsequent years. Therefore, 1931 West Artesia Boulevard retains integrity of setting.

Materials: 1931 West Artesia Boulevard has not had significant, visible exterior alterations over time that have compromised its integrity of materials. This is corroborated by the list of alterations on file with the City of Gardena's Community Development Department. Therefore, 1931 West Artesia Boulevard retains integrity of materials.

Workmanship: Similar to the issue with materials, the little physical evidence of workmanship from builders of 1931 West Artesia Boulevard has not been altered on the exterior. Therefore, 1931 West Artesia Boulevard retains integrity of workmanship.

Feeling: 1931 West Artesia Boulevard still successfully conveys the feeling of being a 1950s Mid-Century Modern small-scale commercial building, and has not experienced significant alterations that would subsequent significantly impact the buildings' ability to convey this feeling. Therefore, the 1931 West Artesia Boulevard retains integrity of feeling.

Association: No important historical associations with events or people were identified for the subject property.

In summary, 1931 West Artesia Boulevard retains integrity of retains most of the aspects of integrity including integrity of location, design, setting, materials, workmanship, and feeling. However, the subject property appears not eligible under all NRHP and CRHR designation criteria for lack of important associations and lack of distinctive characteristics of a style or a master architect.

Preliminary Environmental Evaluation

605 THIRD STREET
ENCINITAS, CALIFORNIA 92024
T 760.942.5147 F 760.632.0164

MEMORANDUM

To:	Debra Bogdanoff, Senior Engineer, Facilities and Property Management Section
From:	Nicole Peacock and Audrey Herschberger, Dudek
Subject:	Preliminary Environmental Evaluation for the Gardena Pumping Plant Project
Date:	April 11, 2019
Attachment(s):	Figure 1: Project Location Figure 2: Project Site Figure 3: Potential Environmental Concerns Attachment A – EDR Report Attachment B – Los Angeles County Department of Public Works File Attachment C - Historic Aerial Photographs Attachment D – Historic City Directories

This Preliminary Environmental Evaluation was conducted for the proposed Gardena Pumping Plant project (proposed project), located in the southern portion of the City of Gardena, adjacent to the City of Torrance border. Generally, the project site is located northwest of the Interstate 405 and State Route 110 intersection and west of the Dominguez Channel. Specifically, the project site is located at 1919, 1931, and 1923 W. Artesia Boulevard, Gardena, California, on Los Angeles County assessor parcel numbers 4094-007-903, 4094-007-005, and 4094-007-004 (see Figure 1, Project Location).

The existing Gardena Pumping Plant is composed of two functionally separate pumping plants referred to as the East Plant and West Plant, constructed side by side within two brick buildings. The proposed project includes consolidation of the East and West Plants into one new pumping plant located adjacent to the existing plant to the west (see Figure 2, Project Site). The proposed project would continue to accept flows from the existing trunk sewers; the influent would be directed to one new wet well via improved cross connections. The proposed project's area of disturbance includes the existing plant, the area of the proposed pumping plant, and a portion of the roadway at Artesia Boulevard.

The proposed project would generally include the following components:

- Replacement of plant superstructure
- Replacement of pumps
- Deep excavation for a new dry/wet well (approximately 40 feet below ground surface [bgs])
- Replacement of the diesel-powered backup generator
- Improvement of force mains and cross connections
- Associated equipment upgrades

The objective of this preliminary environmental evaluation is to determine if there are any potential environmental concerns associated with the proposed project. This preliminary environmental evaluation consists of a review and summary of regulatory agency records, historical city directories, and historical aerial photographs. This preliminary

environmental evaluation is not a phase I environmental site assessment as described in American Society for Testing and Materials (ASTM) 1527-13.

Physical Setting

Geological information was obtained from the GeoCheck® section of the Environmental Data Resources (EDR) Report (Attachment A), unless otherwise cited. The project site is at an elevation of approximately 39 feet above mean sea level, and the topography of the project site and surrounding area is generally flat. The project site is underlain by urban land component soils, which are described as discontinuous human-transported material over mixed alluviums (USDA 2019).

Dudek consulted the California Department of Water Resources Water Data Library (DWR 2019). Two wells were identified in the same location 0.75 miles east-northeast of the project site.[1] Recent water level data (2018) reported a groundwater depth of approximately 34 feet bgs in the shallow well and approximately 64 feet bgs in the deep well.

Groundwater investigations conducted on adjacent properties to the south (see discussions in Table 1, Project Site Regulatory Database Listings), indicate groundwater on the south side of Artesia Boulevard, adjacent to the project site, to be at a depth of approximately 22 to 28.5 feet bgs, with an east-northeasterly flow direction (EMS 2012; AECOM 2012).

The project site and the adjacent properties to the east, west, and north are zoned C-3, General Commercial, by the City of Gardena (City of Gardena 2018). The Artesia Boulevard right-of-way is adjacent to the existing plant to the south. Properties on the south side of Artesia Boulevard are zoned M1, Light Manufacturing, and M2, Heavy Manufacturing, by the City of Torrance (City of Torrance 2015).

Regulatory Records

A search of regulatory records was conducted by EDR on March 6, 2019 (EDR report, Attachment A). The search was conducted for the project site, and includes a 0.25-mile, a 0.5-mile, and a 1-mile search radius as defined in the records review requirements of the ASTM 1527-13 standard. The EDR report gives a listing of sites within the defined search radii that are listed on one or more environmental regulatory databases. Information in these listings includes the site name, location of the site relative to the project site, regulatory database listing, and status of the listed site.

A total of 83 listings were identified in the EDR report. Some of the sites were identified in more than one regulatory database. The number of listings and their proximity to the project site are as follows:

- 16 listings were identified within a 0.125-mile radius
- 38 listings between a 0.125-mile and a 0.25-mile radius
- 19 listings between a 0.25-mile and a 0.5-mile radius
- 10 listings were identified between a 0.5-mile and a 1-mile radius of the proposed project

Of these listings, 39 were identified in databases that are used for permitting, inventory, and regulatory compliance purposes and do not indicate a release of hazardous substances or petroleum products to the environment. The

[1] Groundwater level stations 338765N1182999W001 and 338765N1182999W002.

remaining listings were identified in regulatory databases that identify sites with known or suspected environmental contamination. The regulatory databases identified are summarized in the EDR report (Attachment A).

Dudek reviewed the listings, their distance from the project site, and their known environmental conditions (e.g., groundwater depth and flow direction), and it identified listings that are considered potential environmental concerns to the proposed project. Table 1 summarizes the listings adjacent to the project site and whether Dudek identifies them as potentially impacting the environmental conditions of the project site. Listings not adjacent to the project site have the distance indicated below the address. The additional sites not discussed in Table 1 were reviewed by Dudek and were determined not likely to impact the proposed project.

Table 1. Project Site Regulatory Database Listings

Business Name, Address	Database(s)	Details	Identified Environmental Concern
Sears Roebuck and Company 1917 Artesia Boulevard	CA LUST CA Hist Cortese CA SWEEPS UST	A gasoline release was identified following an underground storage tank (UST) removal in 1989. The case was closed by the regulatory agency in 1996, despite the presence of residual total petroleum hydrocarbons in soil (at 9,300 milligrams per kilogram) and benzene in the shallow groundwater (at 35 micrograms per liter [□g/L]). Dudek reviewed the file for this case, which maintained by the Los Angeles County Department of Public Works (Attachment B). The maps noting the presence of the former UST were not clear: The former UST could have been adjacent to the project site.	Yes, see discussion following Table 1.
Thiem Industries (aka Momin Lodge, former Thiem facility) 1918 Artesia Boulevard	CA Response CA EnviroStor CA LUST CA Cortese CA Hist Cortese RCRA-LQG CA Hist UST	The site is a former metals manufacturing facility, which operated from 1959 to 1994. A series of leaking USTs (LUSTs) and aboveground storage tanks contaminated the soil and groundwater beneath the site; the potential contaminants of concern include 1,4-dioxane, lead, naphthalene, diesel, and volatile organic compounds (VOCs). Indoor air and soil vapor are also potentially contaminated. Investigations began in 2008, including a remedial investigation (RI) conducted in 2012 (EMS 2012). The RI reported shallow groundwater at an elevation of 17.0 feet above mean sea level (approximately 22 feet bgs), with a northeasterly flow direction. The RI also reported groundwater beneath the site to be contaminated with tetrachloroethylene (PCE) and trichloroethylene (TCE) above regulatory cleanup levels. The site is still undergoing remediation, but the responsible party has filed for bankruptcy, and the regulatory agency (Department of Toxic Substance Control [DTSC]) designated it an “orphan site” in 2017.	Yes, see discussion following Table 1.

Table 1. Project Site Regulatory Database Listings

Business Name, Address	Database(s)	Details	Identified Environmental Concern
ALS Industries Inc. 1942 West Artesia Boulevard (100 feet southwest)	CA Response CA EnviroStor	An investigation conducted on an adjoining site identified chlorinated VOCs (CVOCs) on the ALS Industries (ALS) property. Further investigation confirmed that the contamination was not caused by ALS operations, but instead by operations at a nearby property (see Freeman Products, following). The site received a No Further Action designation in 2013, which stated the VOC contamination did not appear to be attributed to ALS operations, and the site did not appear to pose a threat to human health or the environment under its current land use (DTSC 2013). Groundwater contamination may still be present beneath the site. A 2012 RI (AECOM 2012) reports groundwater flows in an east-northeasterly direction, towards the project site.	No
Freeman Products/Avnet Inc. (Freeman) 2040 Artesia Boulevard (670 feet west-southwest)	CA Response CA EnviroStor CA CPS-SLIC CA Cortese LA Co. Site Mitigation RCRA-LQG FINDS ECHO CA EMI	This site has an open cleanup file with the DTSC, active as of 2008. The site was a former metal plating and jewelry manufacturing facility, followed by a trophy and award manufacturing facility. The site is now a church. Historical operations resulted in CVOC contamination to soil, soil gas, and groundwater beneath the site, which has migrated eastward on three adjacent properties (2000 Artesia Boulevard, 1942 Artesia Boulevard, and 1918 Artesia Boulevard). The most-recent groundwater report (Ramboll 2018) reported groundwater at a depth of 23.75 to 28.56 feet bgs, with a northeasterly flow direction. Groundwater monitoring occurs on the Freeman site, as well as the three adjacent sites to the east. The most-recent groundwater data (second quarter, 2018) reports TCE, PCE, 1,1-dichloroethene (1,1-DCE), and 1,4-dioxane above applicable regulatory screening levels (California Maximum Contaminant Levels [MCLs] for Drinking Water for TCE, PCE, and 1,1-DCE, and California Department of Health Services [CDHS] Notification Level (NL) for 1,4-dioxane).	Yes, see discussion following Table 1.

The former Freeman and Thiem Industries (Thiem) sites, located at 2040 Artesia Boulevard and 1918 Artesia Boulevard, respectively, are located south and southwest of the project site (see Figure 3, Potential Environmental Concerns). Historical operations at Freeman and Thiem have contributed to CVOC contamination in groundwater, which is currently under remediation, but still above regulatory screening levels. Recent groundwater data (as cited in Table 1) indicates the CVOC contamination is present beneath the Freeman and Thiem sites, as well as the two sites in between. Figure 3 includes the locations of the nearest groundwater monitoring wells for the Freeman and Thiem sites and the reported CVOC contamination above the applicable screening levels (California MCLs for drinking water are 5 μg/L for TCE and PCE, 6 μg/L for 1,1-DCE; the CDHS NL is 1 μg/L for 1,4-dioxane). Groundwater

has been reported at depths of approximately 22 to 28.5 feet bgs. The closest wells to the project site had elevated concentrations of CVOCs, and because no data exist within or along Artesia Boulevard, which separates the release sites from the project site, there is a data gap. It is possible that impacted groundwater from these release sites has migrated to the area under Artesia Boulevard and possibly under the project site.

As noted in Table 1, the adjacent site to the east (1917 W. Artesia Boulevard) has residual soil and groundwater impacts caused by a release from a former gasoline UST. Although the release case received agency closure, it did so with 35 µg/L benzene detected in the groundwater and 9,500 milligrams per kilogram total petroleum hydrocarbons detected in soil. The former UST may be immediately adjacent to the project site. Therefore, it may be possible that gasoline-impacted soil and/or groundwater is present under the project site.

Additionally, construction of the proposed project would require excavation up to 40 feet bgs. This excavation would encounter groundwater, and therefore require dewatering, which could potentially cause drawdown and subsequent migration of the contaminated groundwater onto the project site. Based on the proposed project components, the groundwater contamination beneath these sites poses a potential environmental concern to the proposed project.

Online Regulatory Databases

Dudek consulted available online databases that provide environmental information on facilities and sites in the State of California. Table 2, Online Database Listings, provides a summary of the databases searched.

Table 2. Online Database Listings

Database	Details
California Environmental Protection Agency (CalEPA) https://siteportal.calepa.ca.gov/nsite/	The CalEPA Regulated Site Portal is a website that combines data about environmentally regulated sites and facilities in California into a single, searchable database and interactive map. Data sources include California Environmental Reporting System, EnviroStor, GeoTracker, California Integrated Water Quality System, and Toxics Release Inventory.
Department of Toxic Substance Control (DTSC) EnviroStor https://www.envirostor.dtsc.ca.gov/	The DTSC's data management system is for tracking cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known contamination or sites where there may be reasons for further investigation.
Regional Water Quality Control Board (RWQCB) GeoTracker http://geotracker.waterboards.ca.gov/	The California RWQCB's data management system is for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater. GeoTracker contains records for sites that require cleanup, various unregulated projects, and permitted facilities. Sites include LUST, Department of Defense, Cleanup Program, Irrigated Lands, Oil and Gas Production, Permitted USTs, and Land Disposal Sites.
National Pipeline Mapping System https://www.npms.phmsa.dot.gov/	The National Pipeline Mapping System Public Map Viewer is a web-based application designed to assist the general public with displaying and querying data related to gas transmission and hazardous liquid pipelines, liquefied natural gas plants, and breakout tanks under Department of Transportation Pipeline and Hazardous Material Safety Administration jurisdiction.

Thirty-one additional sites were identified on the CalEPA database within a 1-mile radius of the project site. These sites are listed for compliance purposes, specifically hazardous material and waste permits, chemical storage permits, air quality permits, and stormwater discharge permits. There is no indication, based on the information provided, that there has been an unregulated release of hazardous substances or petroleum products to the environment.

No additional sites were identified in the DTSC or RWQCB databases within a 1-mile radius of the project site[2] beyond those identified in Table 1. No pipelines or associated features were identified on the National Pipeline Mapping System database within a 1-mile radius of the project site.

Aerial Photographs

Historical aerial photographs (Attachment C) were reviewed to determine if there was evidence of recognized environmental conditions on the project site. Historical aerial photographs from 1928, 1938, 1947, 1952, 1963, 1970, 1977, 1983, 1989, 1994, 2002, 2005, 2009, 2012, and 2016 were reviewed. Observations are presented in Table 3, Historical Aerial Photograph Review.

Table 3. Historical Aerial Photograph Review

Date	Observations
1928, 1938	The project site appears to be developed with a small building on the same parcel as the current pumping station. The western portion of the project site appears agriculturally developed. According to site history (Dudek 2019), the building is likely the East Plant, which was constructed, along with Force Main No. 1, in 1928. The property adjacent to the west is agriculturally developed with apparent row crops similar to those on the western portion of the project site. The property adjacent to the east appears undeveloped, and a canal traverses the site. Artesia Boulevard is located to the south. The surrounding area is mainly agriculturally developed.
1947	The Dominguez Channel has been constructed to the east of the project site. The project site and surrounding property uses appear similar as compared to the 1938 aerial photograph.
1952	The project site and land immediately to the east and west along Artesia Boulevard appear disturbed; structures and vegetation have been removed, with the exception of a tree line leading northward from Artesia Boulevard through the project site and near the existing structure. Structures are located on the properties to the south, on the south side of Artesia Boulevard. Commercial and residential development in the area has increased.
1963	The eastern portion of the project site appears to be under construction, where the current pumping station is located. There are structures in the center and on the east side of the property, but they do not appear to be complete. According to site history, the West Plant and Force Main No. 2 were constructed in 1960 (Dudek 2019). The western portion of the project site is developed with at least one L-shaped commercial structure. The main structure appears to cover portions of both of the western parcels. Smaller structures are located around the main building. Artesia Boulevard appears to be a divided roadway. The property adjacent to the east is bare land, but appears to be used for material or vehicle storage/parking. The property adjacent to the west is developed with commercial buildings. Two large commercial buildings are located on the south side of Artesia Boulevard. Trailer parks are observed to the north and southeast, adjacent to Dominguez Channel. Residential properties are observed beyond the commercial areas in all directions.

[2] LUST sites on the RWQCB database were only researched within a 0.5-mile radius of the project site, as per the ASTM 1527-13 standard.

Table 3. Historical Aerial Photograph Review

Date	Observations
1970	The project site appears to be developed with the currently existing buildings, pavement, and roadways (i.e., Artesia Boulevard). An additional structure is located in the northwest corner of the project site. Surrounding development has increased slightly; land uses appear similar to those observed in the 1963 aerial photograph.
1977	Two new structures are observed on the property to the northeast of the project site, north of the current pumping station. Both appear to be commercial structures. The surrounding areas appear similar as compared to the 1970 aerial photograph.
1983, 1989, 1994, 2002	The project site and adjoining properties remain apparently unchanged as compared to the 1977 aerial photograph. The surrounding area land use appears consistent, with slight variations in commercial structures in the surrounding areas (i.e., demolition and reconstruction of some properties greater than 500 feet from the project site).
2005	The northeastern-most structure on the project site has been removed, replaced with a paved ground surface. The main structure is now composed of two rectangles, side by side and offset north–south. The remainder of the project site and surrounding area appears unchanged as compared to the 2002 aerial photograph.
2009, 2012, 2016	The northern half of the building on the southern adjacent property (south of Artesia Boulevard) has been demolished. The southern half of the commercial structure is still present. The land appears under demolition in 2009, covered in grass in 2012, and is paved parking in 2016. The project site and remaining adjacent properties appear similar as compared to the 2005 aerial photograph, and appear to reflect current site conditions.

City Directories

City Directory listings were requested from EDR (Attachment D). The directories provide insight on historical uses of properties. The project site addresses and nearby addresses were requested. Table 4, Historical City Directory Review, provides a summary of the findings for the project site and surrounding properties with commercial and/or industrial listings of interest.

Based on the findings of the city directories, the project site and surrounding areas have been used for commercial and light-industrial purposes since at least 1970. In the 1970s, the project site was used for upholstery cleaning, which likely included solvent dry cleaning. The project site was also used for ball manufacturing, which likely involved the use of some chemicals, from the 1970s until the 1990s. Additional site uses noted in the City Directory appear to be related to office or commercial uses.

Summary and Conclusions

The existing Gardena Pumping Plant is located northwest of the I-405 and SR-110 intersection and west of the Dominguez Channel, at 1919 Artesia Boulevard, Gardena, California 90274, Los Angeles County assessor parcel number 4094-007-903. The proposed project includes consolidation of the East and West Plants into one new pumping plant located adjacent to the existing plant to the west. The proposed project would continue to accept flows from the existing trunk sewers; the influent would be directed to one new wet well via improved cross connections. The proposed project's area of disturbance includes the existing plant, the property of the proposed pumping plant (west of the existing plant and encompassing the parcels that makes up 1923 and 1931 Artesia Boulevard, assessor parcel numbers 4094-007-005 and 4094-007-004, respectively), and a portion of the roadway at Artesia Boulevard. Excavation for the new wet well would be to approximately 40 feet bgs.

The project site has been developed since at least 1928. The East Plant and Force Main No. 1 were constructed in 1928, the West Plant and Force Main No. 2 were constructed in 1960, and Force Main No. 3 was constructed in 1995. The property of the proposed pumping plant was agricultural land prior to commercial/light-industrial development beginning in at least 1963. Artesia Boulevard has been present since at least 1928, with redevelopment from a two-lane road to a four-lane divided road between 1952 and 1963. The immediately adjacent properties are commercial to the north, east, and west, and industrial to the south.

Government Code Section 65962.5 requires the California Environmental Protection Agency (CalEPA) to compile a list of hazardous waste and substances sites (Cortese List). While the Cortese List is no longer maintained as a single list, the following databases provide information that meets the Cortese List requirements:

1) List of hazardous waste and substances sites from DTSC EnviroStor database (Health and Safety Codes 25220, 25242, 25356, and 116395);
2) List of open, active LUST sites by county and fiscal year from the State Water Resources Control Board (Water Board) GeoTracker database (Health and Safety Code Section 25295);
3) List of solid waste disposal sites identified by the Water Board with waste constituents above hazardous waste levels outside the waste management unit (Water Code Section 13273(e) and California Code of Regulations Title 14, Section 18051);
4) List of "active" cease and desist orders and cleanup and abatement orders from the Water Board (Water Code Sections 13301 and 13304); and
5) List of hazardous waste facilities subject to corrective action pursuant to Health and Safety Code Section 25187.5, identified by DTSC.

Multiple sites were identified on Cortese List databases within a 1-mile radius of the project site; however, the project site was not listed. The project site is adjacent to 1917 Artesia Boulevard address, which was listed in the Water Board's LUST database; however, the release case has been closed.

Table 1 details listings adjacent to the project site and listings that Dudek believes may impact the environmental conditions of the proposed project, based on distance from the project site, known groundwater gradients, and status of the identified listing. However, the information reviewed is not conclusive of an impact to the project site. The following sites were determined to be potential environmental concerns to the proposed project:

- The adjacent site to the east (1917 W. Artesia Boulevard) was the former location of a gasoline UST. Following UST removal in 1987, residual soil and groundwater impacts were identified beneath the former UST. Although the release case received agency closure, it did so with 35 μg/L benzene detected in the groundwater. The location of the former UST is not known because of the poor figures in the UST case reports; it may be immediately adjacent to the project site. Therefore, it is possible that gasoline-impacted soil and/or groundwater is present under the project site.
- The former Freeman and Thiem sites, located at 2040 Artesia Boulevard and 1918 Artesia Boulevard, respectively, are located south and southwest of the project site (see Figure 3). Historical operations at Freeman and Thiem have contributed to CVOC contamination in groundwater, which is currently under remediation but still above regulatory screening levels. Recent groundwater data (as cited in Table 1) indicate the CVOC contamination is present beneath the Freeman and Thiem sites, as well as the two sites in between. Figure 3 includes the locations of the nearest groundwater monitoring wells for the Freeman and Thiem sites and the reported CVOC contamination above the applicable screening levels (California MCLs for drinking water are 5 μg/L for TCE and PCE, 6 μg/L for 1,1-DCE; the CDHS NL is 1 μg/L for 1,4-dioxane). Groundwater has been reported at depths of approximately 22 to 28.5 feet bgs. While data suggest that contaminated groundwater has not migrated north into Artesia Boulevard or the project site, construction of the proposed project would require excavation up to 40 feet bgs. This excavation would encounter groundwater, thereby requiring dewatering, which could potentially cause drawdown and subsequent migration of the contaminated groundwater onto the project site. Based on the proposed

project components, the groundwater contamination beneath these sites poses a potential environmental concern to the proposed project.

In addition, the history of the project site has identified the following items of potential environmental concern:

- Based on the findings of the city directories, the project site and surrounding areas have been used for dry cleaning and manufacturing purposes since at least 1970. These types of industries generally use, store, and dispose of hazardous materials and petroleum products as part of daily business activities. Dry cleaners in the 1970s would have used chlorinated solvents. Based on the potential former use of chlorinated solvents on the project site and other potential chemical use, there is a potential for undocumented environmental contamination to be present, which may impact the project site.
- Based on the age of the structures (pre-1980s) on the project site, there is a potential for asbestos, lead-based paint, and other hazardous building materials, such as polychlorinated biphenyls and mercury, to be present in the building materials. Construction of the proposed project would require demolition of the existing structures on the western portion of the project site.

A hazardous materials management plan, or similar document, should be prepared to manage potentially impacted soils and groundwater encountered during excavation and dewatering. Additionally, air monitoring should occur during excavation activities to protect worker and public health.

Prior to demolition of any structures, a hazardous building materials survey should be conducted. Should hazardous building materials be identified during the survey, a licensed abatement contractor should be hired to properly abate the identified materials in accordance with federal, state, and local laws and regulations.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 12/13/2018 has revealed that there are 7 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 3 RCRA-LQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 10 RCRA-SQG sites within approximately 0.25 miles of the target property.

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 01/28/2019 has revealed that there are 17 CA ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

State and tribal leaking storage tank lists

CA LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CA LUST list, as provided by EDR, has revealed that there are 12 CA LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

CA UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the CA UST list, as provided by EDR, has revealed that there are 7 CA UST sites within approximately 0.25 miles of the target property.

State and tribal voluntary cleanup sites

CA VCP: Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

A review of the CA VCP list, as provided by EDR, and dated 01/28/2019 has revealed that there are 2 CA VCP sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: The EPA's listing of Brownfields properties from the Cleanups in My Community program,

which provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

A review of the US BROWNFIELDS list, as provided by EDR, and dated 12/17/2018 has revealed that there are 2 US BROWNFIELDS sites within approximately 0.5 miles of the target property.

Local Lists of Registered Storage Tanks

CA SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the CA SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there

are 8 CA SWEEPS UST sites within approximately 0.25 miles of the target property.

Local Land Records

CA DEED: The use of recorded land use restrictions is one of the methods the DTSC uses to protect the public from unsafe exposures to hazardous substances and wastes .

A review of the CA DEED list, as provided by EDR, and dated 12/03/2018 has revealed that there is 1

CA DEED site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Handler Activities Summary:
U.S. importer of hazardous waste: No

TESORO 97610 1235 (Continued) **1015752998**

Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Historical Generators:

FINDS:

Registry ID: 110054824543

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as

CONTROL PLATING COMPANY INC (Continued) **U001563051**

cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D007
. Waste name: CHROMIUM

. Waste code: F006
. Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Historical Generators:
Date form received by agency: 03/01/2006

Potential Media Affected: Aquifer used for drinking water supply, Soil Vapor
Potential Contaminants of Concern: Not reported
Site History: Beginning in 1953, Honeywell operated a manufacturing facility for gas furnace control valves at the Site. These manufacturing operations continued until 1991. The plant was demolished the following year, and the Site was subsequently redeveloped. During the period from June 1984 to July 1989, more than 20 monitoring wells were installed in and around the Site to evaluate groundwater quality and flow. TCE and PCE were the principal chemicals of potential concern identified in groundwater. To address these VOCs,groundwater extraction wells and a groundwater treatment system (GWTS) were constructed in 1990 and began operation the following year. The groundwater beneath the Site occurs at approximately 20 feet below ground surface (bgs). Site redevelopment as a shopping center required the relocation of the system and abandonment of several wells in 1999. In July 2002, in response to direction from the California Regional Water Quality Control Board (RWQCB), three groundwater monitoring wells were installed in the adjacent Lot 6 and were included in the monitoring program. However, two of the Lot 6 groundwater monitoring wells, MW-19 and MW-20, were abandoned during the Fourth Quarter of 2006 because of construction activities at Lot 6 and were replaced with two new monitoring wells, MW-19A and MW-20A. The two new wells are located in Lot 5 in accordance with the plan approved by the RWQCB. Honeywell operates the Site GWTS to discharge the treated Site groundwater under the existing National Pollutant Discharge Elimination System (NPDES) permit (CA0062162), issued by the RWQCB. Groundwater is pumped from the extraction wells into a 1,500-gallon influent tank. From the influent tank, the water is pumped through a sand filter, through a bag filter, and then into two 1,000-pound liquid-phase granular activated carbon (LGAC) vessels

HONEYWELL INCORPORATED (Continued) **1000226458**

(running in series). The VOCs are removed from the water by adsorption onto the LGAC media. After LGAC treatment, the water is pumped into two sets of ion exchange (IX) tanks and granular ferric hydroxide (GFH) tanks (running in parallel). The IX and GFH treatment is required to remove low concentrations of naturally occurring metals from the Site groundwater per the NPDES discharge requirements. The treated groundwater is then pumped into the City of Gardena stormwater system discharge pipe. The connection to the City of Gardena stormwater system is near the southwest corner of the property (the northeast corner of the intersection of Western Boulevard and Artesia Boulevard). In January 2013, Regional Board staff received and completed a review of the "Groundwater Remedial Process Optimization Treatment Review and Work Plan" (Work Plan) prepared by CH2MHILL Inc. on behalf of Honeywell In April 2013, Regional Board staff approved the work plan for the enhanced reductive dechlorination (ERD) biobarrier system for the in-situ treatment/containment of the groundwater plume at the Site. Currently DTSC is the lead agency for purposes of soil and soil remediation oversight above the saturated zone (about 20 feet down), and for purposes of approving the vapor barrier design to be installed at the site. RWQCB is the lead agency for matters related to the groundwater treatment including the Enhanced Reduction Dechlorination wells (ERD Wells), any extraction wells (EWs), and any monitoring wells (collectively Wells).

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D018
. Waste name: BENZENE

Violation Status: No violations found

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002

ALBERTSONS 6108 (Continued) **1019322562**

. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Completed Document Type:	Removal Action Workplan
Completed Date:	05/14/2004
Comments:	- The Removal Action Workplan (RAW) for this site includes plans for re-locating residents and removing trailers in the Southern three rows. PCB-impacted soil will be excavated and disposed, and the site restored. Comments received from the public were addressed in a Response to Comments letter. - A Notice of Exemption (NOE) was finalized for this site in Gardena with PCB contamination underneath two trailer rows. The NOE is for a RAW which includes excavation and disposal of soil. No comments on the draft NOE were received.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: Yes
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: 221
. Waste name: Waste oil and mixed oil

. Waste code: F037
. Waste name: PETROLEUM REFINERY PRIMARY OIL/WATER/SOLIDS SEPARATION SLUDGE-ANY SLUDGE GENERATED FROM THE GRAVITATIONAL SEPARATION OF OIL/WATER/SOLIDS DURING THE STORAGE OR TREATMENT OF PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH SLUDGES INCLUDE, BUT ARE NOT LIMITED TO, THOSE GENERATED IN: OIL/WATER/SOLIDS SEPARATORS; TANKS AND IMPOUNDMENTS; DITCHES AND OTHER CONVEYANCES; SUMPS; AND STORMWATER UNITS RECEIVING DRY WEATHER FLOW. SLUDGE GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED FROM NON-CONTACT ONCE-THROUGH COOLING WATERS SEGREGATED FOR TREATMENT FROM OTHER PROCESS OR OILY COOLING WATERS, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS) AND K051 WASTES ARE NOT INCLUDED IN THIS LISTING.

. Waste code: F038
. Waste name: PETROLEUM REFINERY SECONDARY (EMULSIFIED) OIL/WATER/SOLIDS SEPARATION SLUDGE-ANY SLUDGE AND/OR FLOAT GENERATED FROM THE PHYSICAL AND/OR CHEMICAL SEPARATION OF OIL/WATER/SOLIDS IN PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH WASTES INCLUDE, BUT ARE NOT LIMITED TO, ALL SLUDGES AND FLOATS GENERATED IN: INDUCED AIR FLOTATION (IAF) UNITS, TANKS AND IMPOUNDMENTS, AND ALL SLUDGES GENERATED IN DAF UNITS. SLUDGES GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED FROM NON-CONTACT ONCE-THROUGH COOLING WATERS SEGREGATED FOR TREATMENT FROM OTHER PROCESS OR OILY COOLING WATERS, SLUDGES AND FLOATS GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES AND FLOATS GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS) AND F037, K048, AND K051 WASTES ARE NOT

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Completed Date: 03/07/2008
Comments: On March 20, 2008, DTSC met with the representative from Atlantic Richfield Company (ARC), a subsidiary of British Petroleum, to discuss questions that he had on DTSC's comments on both the draft RI report and the 3rd quarter groundwater monitoring report. DTSC was unable to answer all of his questions during the meeting. It was decided that ARC would not submit a new Report, but would incorporate the comments into the next quarterly report. On March 25, 2008, ARC confirmed this in a letter to DTSC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Consent Order
Completed Date: 06/21/2004
Comments: DTSC signed Consent Agreement with Atlantic Richfield Company (ARC), whereby ARC agreed to pay $800,000 of DTSC’s administrative costs and to perform an RI/FS on the site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Consent Order
Completed Date: 05/28/1997
Comments: DTSC and Haack have signed a settlement with ONLY Haack and his Estate. Haack has agreed to place a concrete "cap" over the remaining areas of the most severe and publicly accessible con- tamination on his property. He has also agreed to remove additional seep materials should they migrate onto public rights of way after the cap is installed, up to 2 standard drums a year. Settlement money will be reduced by $2/sq. ft. for capping over 3000 sq. ft., subject to mutual measurements.

Completed Document Type: Removal Action Workplan
Completed Date: 05/27/1998
Comments: Removal Action on Haack Property. Capping of PAH contaminated soil with 7400 sq ft of 6" steel reinforced concrete with a a vapor barrier.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Risk Assessment Report
Completed Date: 06/08/1995
Comments: The Department reviewed and approved the Health Risk Assessment prepared by Tetra Tech, Inc. for the Gardena Sumps site. Due to the lack of available funding for this site, the Feasibility Study will not be performed.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 03/03/1994
Comments: Removal action completed. Exposed areas of hazardous substances contaminated with black oily sludge which was seeping to the surface of the Southern Pacific Line's (SPL) property was covered with a layer of clean fill dirt. In addition, a fence was in- stalled around this portion of the SPL property which borders the Gardena Sumps. The fence encloses approximately 12,000 square feet.

Completed Date: 03/07/2008
Comments: On March 20, 2008, DTSC met with the representative from Atlantic Richfield Company (ARC), a subsidiary of British Petroleum, to discuss questions that he had on DTSC's comments on both the draft RI report and the 3rd quarter groundwater monitoring report. DTSC was unable to answer all of his questions during the meeting. It was decided that ARC would not submit a new Report, but would incorporate the comments into the next quarterly report. On March 25, 2008, ARC confirmed this in a letter to DTSC.

Completed Document Type: Consent Order
Completed Date: 06/21/2004
Comments: DTSC signed Consent Agreement with Atlantic Richfield Company (ARC), whereby ARC agreed to pay $800,000 of DTSC's administrative costs and to perform an RI/FS on the site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Consent Order
Completed Date: 05/28/1997
Comments: DTSC and Haack have signed a settlement with ONLY Haack and his Estate. Haack has agreed to place a concrete "cap" over the remaining areas of the most severe and publicly accessible con- tamination on his property. He has also agreed to remove additional seep materials should they migrate onto public rights of way after the cap is installed, up to 2 standard drums a year. Settlement money will be

GARDENA SUMPS (Continued) **S118466263**

reduced by $2/sq. ft. for capping over 3000 sq. ft., subject to mutual measurements.

Completed Date: 05/27/1998
Comments: Removal Action on Haack Property. Capping of PAH contaminated soil with 7400 sq ft of 6" steel reinforced concrete with a a vapor barrier.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Risk Assessment Report
Completed Date: 06/08/1995
Comments: The Department reviewed and approved the Health Risk Assessment prepared by Tetra Tech, Inc. for the Gardena Sumps site. Due to the lack of available funding for this site, the Feasibility Study will not be performed.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 03/03/1994
Comments: Removal action completed. Exposed areas of hazardous substances contaminated with black oily sludge which was seeping to the surface of the Southern Pacific Line's (SPL) property was covered with a layer of clean fill dirt. In addition, a fence was in- stalled around this portion of the SPL property which borders the Gardena Sumps. The fence encloses approximately 12,000 square feet.

Description: Historically, clay was excavated from this site for industrial purposes. In the 1930's, the excavations were used for the disposal of oily hazardous wastes. This disposal continued until the late 1950's. The wastes disposed of onsite included refinery wastes, tank bottom sludges, and rinse water acids. There are four sumps onsite, two of which are visible and the other two are buried. Hazardous substances found onsite include a wide variety of petroleum hydrocarbon wastes, base neutral acids, and some heavy metals generated from drilling and petroleum refining. Sludges are of a highly acidic nature. The estimated amount of waste on the site is 16,000 tons. The hydrocarbon wastes are highly acidic and present a potential health hazard through direct contact with the skin. Additionally wastes may emit gases containing volatile organic compounds, or other sulfur containing gases, presenting a potential inhalation hazard. In 1981, the Department collected grab samples from the visible sumps. The samples revealed the presence of heavy metals and a pH of less than two. In 1982, EPA's Technical Assistance (TAT) conducted a geological survey, sampled the sumps, and installed four offsite groundwater monitoring wells. This investigation confirmed the presence of benzene, toluene, ethyl benzene, trichloroethylene, and heavy metals in soils. DHS performed a preliminary assessment and site investigation in 1986, to evaluate site contamination. Based on the findings of this investigation, a Remedial Action Order was issued on March 3, 1988, to the two property owners where the sumps exist. An Imminent and/or Substantial Endangerment Determination was made by DHS in July 1988. Based on this determination, the landowners were required to fence and secure the site and remove materials seeping from the sumps to offsite areas. One of the landowners has complied. The other landowner secured and capped his portion of the site, but did not remove the hazardous waste from his property, nor did he reimburse DTSC for its costs. Atlantic Richfield Company has entered into a consent agreement with DTSC to remediate the site.

Background Info: Historically, clay was excavated from this site for industrial purposes. In the 1930's, the excavations were used for the disposal of oily hazardous wastes. This disposal continued until the late 1950's. The wastes disposed of onsite included refinery wastes, tank bottom sludges, and rinse water acids. There are four sumps onsite, two of which are visible and the other two are buried.
Hazardous substances found onsite include a wide variety of petroleum hydrocarbon wastes, base neutral acids, and some heavy metals generated from drilling and petroleum refining. Sludges are of a highly acidic nature. The estimated amount of waste on the site is 16,000 tons.
The hydrocarbon wastes are highly acidic and present a potential health hazard through direct contact with the skin. Additionally wastes may emit gases containing volatile organic compounds, or other sulfur containing gases, presenting a potential inhalation hazard.
In 1981, the Department collected grab samples from the visible sumps. The samples revealed the presence of heavy metals and a pH of less than two. In 1982, EPA's Technical Assistance (TAT) conducted a geological survey, sampled the sumps, and installed four offsite groundwater monitoring wells. This investigation confirmed the presence of benzene, toluene, ethyl benzene, trichloroethylene, and heavy metals in soils.
DHS performed a preliminary assessment and site investigation in 1986, to evaluate site contamination. Based on the findings of this investigation, a Remedial Action Order was issued on March 3, 1988, to the two property owners where the sumps exist. An Imminent and/or Substantial Endangerment Determination was made by DHS in July 1988. Based on this determination, the landowners were required to fence and secure the site and remove materials seeping from the sumps to offsite areas. One of the landowners has complied. The other landowner secured and capped his portion of the site, but did not remove the hazardous waste from his property, nor did he reimburse DTSC for its costs. Atlantic Richfield Company has signed a consent agreement with DTSC, but this still as to be approved by a federal court judge.

CA BOND EXP. PLAN:
Reponsible Party: DETAILED SITE EXPENDITURE PLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: The drilling, transportation, and manufacturing companies which disposed of wastes have not been definitively identified. Both of the landowners named in the RAO have indicated willingness to undertake and fund further site characterization and remediation required in the order. Uncertainty remains as to whether these landowners can fund remedial activities. If all PRPs are found to be in noncompliance, DHS will initiate remedial activities. If Bond funds are used, DHS will undertake appropriate cost recovery activities.
Site Description: This is an abandoned refinery and oil field waste disposal site. The wastes are believed to have been disposed of in sumps over a 15 year period ending in the 1950s.
Hazardous Waste Desc: Hazardous substances found onsite include a wide variety of petroleum hydrocarbon wastes, polychlorinated biphenyls (PCBs) and some heavy metals generated from drilling and petroleum refining. Sludges are of a highly acidic nature. The estimated amount of waste on the site is 16,000 tons.
Threat To Public Health & Env: The hydrocarbon wastes are highly acidic and present a potential health hazard through direct contact with the skin. Additionally wastes may emit gases containing volatile organic compounds, or other sulfur containing gases, presenting a potential inhalation hazard.
Site Activity Status: DHS performed a preliminary assessment and site investigation in 1986 to evaluate site contamination. Based on the findings of this investigation, a remedial action order was issued on March 3, 1988 to the two property owners where the sumps exist. Should both property owners fail to comply with the order, DHS will initiate remedial activities. An imminent and substantial endangerment determination was made by DHS in July, 1988. Based on this determination, the landowners were required to fenceand secure the site and remove materials seeping from the sumps to offsite areas.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/12/2018

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 02/11/2019

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health

Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

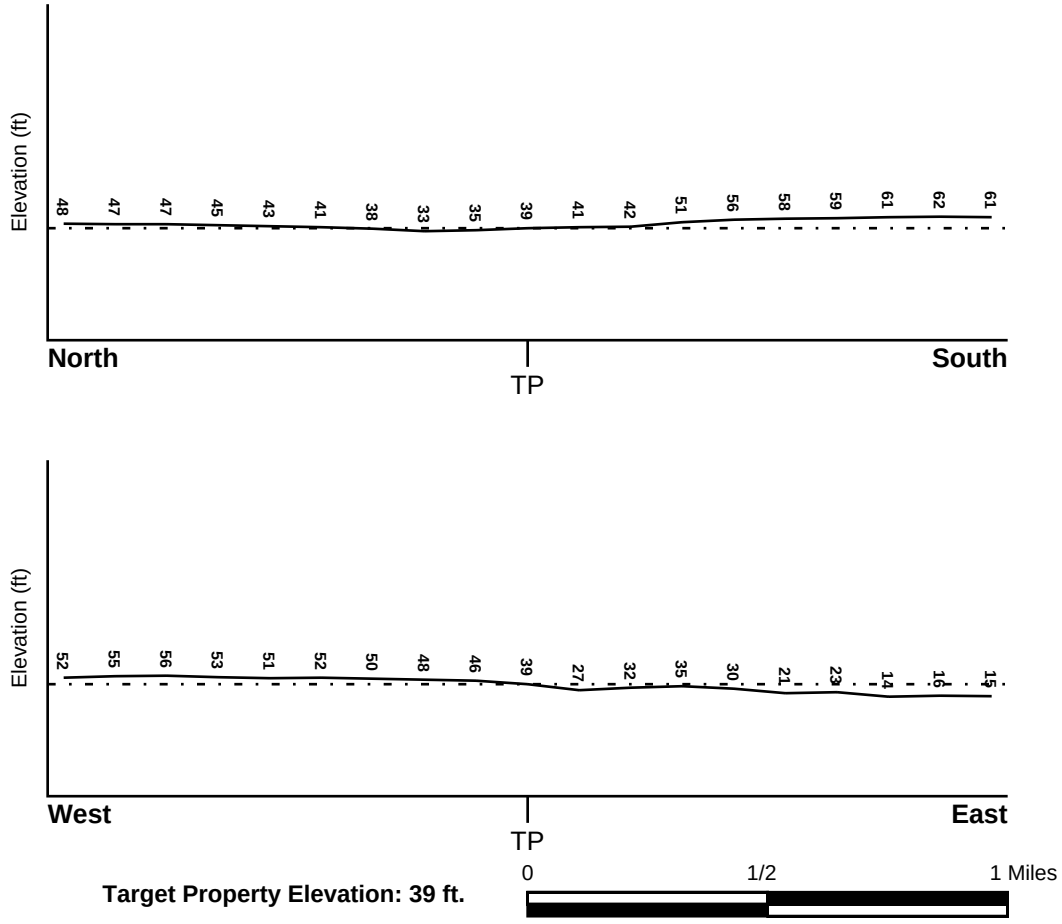
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 39 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1935F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1790F	FEMA FIRM Flood data

06037C1930F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
TORRANCE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/8 - 1/4 Mile NNW
Site Name:	CONTROL PLATING CO INC
Site EPA ID Number:	CAD040938565
Groundwater Flow Direction:	VARIES FROM NE TO SE IN THE GARDENA AQUIFER BECAUSE THE SITE IS LOCATED NEAR A GROUNDWATER DIVIDE. HOWEVER, THE FLOW DIRECTION IS E IN THE LOWER SILVERADO AND LYNWOOD AQUIFERS.
Measured Depth to Water:	unknown.
Hydraulic Connection:	The uppermost sediments at the site are the Lakewood formation silts and clays that extend to a depth of approximately 280 feet. The Gardena aquifer is situated at the base of the Lakewood formation. The lower aquifers include the Lynwood and Silverado.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
B12	1/2 - 1 Mile WSW	S
1G	1/2 - 1 Mile WSW	S

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
sandy loam
gravelly - sandy loam
silt loam
clay
fine sand
gravelly - sand

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

UNDERGROUND STORAGE TANK CASE CLOSURE
SEARS, ROEBUCK AND COMPANY
1917 WEST ARTESIA BOULEVARD, GARDENA, CALIFORNIA
(FILE NO. 902470061)

Dear Mr. Demuth:

This letter confirms the completion of the site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location.

Based on the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721(e).

If you have groundwater monitoring wells or vapor extraction wells at the subject property, you must comply with the following:

1. All wells must be located and properly abandoned.

2. Well abandonment permits must be obtained from the Los Angeles County Department of Health Services, and all other necessary permits must be obtained from the appropriate agencies prior to the start of work.

3. You must submit a report on the abandonment of the wells to this office by January 31, 1997. This report must include, at a minimum, a site map, a description of the well abandonment process, and copies of all signed permits.

L 182545

Please contact Yue Rong at (213) 266-7604 if you have any questions regarding this matter.

Sincerely,

ROBERT P. GHIRELLI, D. Env.

Dear Mr. Empey:

HAZARDOUS MATERIALS UNDERGROUND STORAGE
SITE INVESTIGATION REPORT
FACILITY AT: 1917 West Artesia Boulevard, Gardena, CA 90247

This office has revised the site investigation report submitted for the above facility. The report is not approved because of the reasons checked below:

[ ] The exact extent of contamination has not been defined. _____

[ ] The proposed remedial action is inadequate. _____

[x] There is significant contamination at this site. Pursuant to Section 25297(b) of the California Health and Safety Code, we are referring the matter to the State Regional Water Quality Control Board. For further information regarding the Board's requirements, please contact Mr. Joshua Workman at 107 S. Broadway, Room 4027, Los Angeles, CA 90012, (213) 620-5662. All future correspondence shall be directed to the Board with a copy sent to this office.

[ ] Other _____

Make the required corrections as indicated above and submit a revised report to this office by _____.

If you have any questions concerning this matter, please contact Mr. John Huff at (213) 226-4018.

Very truly yours,

T. A. TIDEMANSON

INTRODUCTION

A single 10,000 gallon gasoline tank was removed from the Sears facility in Gardena on May 13, 1987. Three samples were recovered beneath the tank and transported to a laboratory for quantitative analysis for total petroleum hydrocarbons (TPH). The sample recovered under the south end of the tank had a reported TPH level of 9,300 ppm (see previously submitted tank removal report). Thus, on June 1, 1987, P.I.C. registered geologist Tim Hersch attempted to recover a deeper sample under the south end of the excavated tank pit. He was able to bore down approximately 7 feet beneath tank bottom to a total depth of 20 feet below grade. At that depth he encountered a perched water horizon and thus did not recover a soil sample.

In order to determine the vertical and lateral extent of contamination in accordance with Los Angeles County Determination letter (Appendix A) and to establish the impact on groundwater, two groundwater monitoring wells were completed on July 1, 1987.

Soil samples were recovered during drilling and groundwater samples were recovered subsequent to proper well development. These samples were analyzed for total petroleum hydrocarbons and aromatic volatile organics as appropriate.

PROCEDURE

A B53 drilling rig was used to complete two vertical groundwater monitoring wells on July 1, 1987 (for well locations see Figure 1; Site Sketch Map). Soil samples were recovered during drilling at a depth of 5', 10', and 20' in both borings (see Appendix B; Boring Logs). Soil samples were recovered with a three-inch split-spoon sampler and inserted brass rings. The brass rings were sealed with teflon caps, placed in ice, and transported to Chemical Research Labortories for quantitative analysis.

Groundwater was encountered in B1 and B2 at a measured depth of 20' and 22' below grade, respectively. Drilling continued to a total depth of 42 feet in both borings, and groundwater wells were completed. Slotted 4" PVC casing extended from a depth of 11' to 42' below ground surface. Monterey #3 sand was used as a filter pack and extended from well bottom to the top of the slotted casing. Blank 4" PVC casing was set from a depth of 11' below surface to grade. A 1' bentonite seal was placed above the filter pack. Cement slurry filled the remaining annulus from 10' below surface to grade. Caps were placed on both ends of the casing and the water tight wellhead was fixed in a locking traffic box.

The wells recovered for over two weeks before water sampling. On July 17, 1987 PIC geologist Mr. Don Prince returned to the site and recovered one groundwater sample from each well. An appropriate volume of water was pre-bailed from the wells to ensure the recovery of representative samples. The samples were recovered with an acrylic bailer, placed on ice, and transported to Chemical Research Laboratories (see Appendix C; Chain of Custody). Neither of the water samples recovered from the wells had any field evidence of petroleum hydrocaron contamination.

GEOLOGY

Boring activity at the Sears facility revealed that the soil types underlying and surrounding the tank pit are composed of approximately 20' of gray to brown, cohesive clay overlying fine grained, micaceous, clayey sand. The elevation of the tank pit site is approximately 50' above sea level. Depth to groundwater is approximately 20' below surface, with east being the most likely direction of groundwater flow.

TESTING RESULTS

The soil and groundwater samples were transported the same day as recovery to Chemical Research Laboratories in Stanton. The soil samples collected on July 1, 1987 were tested for total petroleum hydrocarbons using EPA method 8015. The groundwater samples were tested for total petroleum hydrocarbons using EPA method 8015 and for aromatic volatile organics (BTX) using EPA method 602.

All of the soil samples except the one recovered from a depth of 20' below grade in B2 exhibited nondetectible levels of

total petroleum hydrocarbons. Sample B2 - 20' measured a total petroleum hydrocarbon concentration of 40 ppm. The groundwater sample recovered from B1 measured nondetectable total petroleum hydrocarbon and BTX concentrations at a detection limit of 100 ppb and 1 ppb respectively. The groundwater sample recovered from B2 measured a total petroleum hydrocarbon concentration of 2000 ppb, benzene concentration of 35 ppb, and a total xylene concentration of 15 ppb. Toluene and ethyl benzence were non detected at 10 ppb (see Appendix D; Laboratory Results).

CONCLUSIONS AND RECOMMENDATIONS

The drilling activity and groundwater investigation at the Sears facility suggest that although contamination does exist in the soil directly underlying the tank pit, soil contamination does not extend laterally, even in the down gradient direction. In addition, the vertical migration of the contaminant is confined by groundwater at a depth of 20'.

Based on these conclusions, PIC recommends that the gasoline-contaminated soil which was both removed from the tank pit and still underlies the former tank be excavated, spread, and passively soil farmed on the site. The Sears/Gardena facility is ideal for soil farming because a large paved area is available for spreading the soil, the farm can be placed over 300' from the nearest street, and the facility is located in an industrial area of Gardena so that a soil farm would present no substantial nuisance to residents. In addition, the volatility of gasoline results in a rapid attenuation of TPH levels in soil when

passively farmed. Upon documentation of successful soil remediation by passive aeration, the soil will be used as fill material in the excavated tank pit. Remediation of impacted groundwater will be coordinated with appropriate agencies including the California Regional Water Quality Control Board.

This report is proprietary and confidential, to be delivered to, and intended for the exclusive use of, the above named client only. Petroleum Industry Consultants, Inc. assumes no responsibility nor liability for the reliance herein or use hereof by anyone other than the above named client. ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051, in order to complete the evaluation of Closure Permit No. 2683B.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.

[ ] Insufficient number of samples were obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[ ] Submit logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at DOHS certified laboratory.

[X] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil.

[ ] Signature on the report is required of CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

[X] Define the vertical and lateral extent of contamination.

[X] Propose a remedial action plan to mitigate contamination.

[ ] Other _____

INTRODUCTION

A single 10,000 gallon gasoline tank was removed from the Sears facility in Gardena on May 13, 1987. Three samples were recovered beneath the tank and transported to a laboratory for quantitative analysis for total petroleum hydrocarbons (TPH). The sample recovered under the south end of the tank had a reported TPH level of 9,300 ppm (see previously submitted tank removal report). Thus, on June 1, 1987, P.I.C. registered geologist Tim Hersch attempted to recover a deeper samole under the south end of the excavated tank pit. He was able to bore down approximately 7 feet beneath tank bottom to a total depth of 20 feet below grade. At that depth he encountered a perched water horizon and thus did not recover a soil sample.

In order to determine the vertical and lateral extent of contamination in accordance with Los Angeles County Determination letter (Appendix A) and to establish the impact on groundwater, two groundwater monitoring wells were completed on July 1, 1987.

Soil samples were recovered during drilling and groundwater samples were recovered subsequent to proper well development. These samples were analyzed for total petroleum hydrocarbons and aromatic volatile organics as appropriate.

PROCEDURE

A B53 drilling rig was used to complete two vertical groundwater monitoring wells on July 1, 1987 (for well locations see Figure 1; Site Sketch Map). Soil samples were recovered during drilling at a depth of 5', 10', and 20' in both borings (see Appendix B; Boring Logs). Soil samples were recovered with a three-inch split-spoon sampler and inserted brass rings. The brass rings were sealed with teflon caps, placed in ice, and transported to Chemical Research Labortories for quantitative analysis.

Groundwater was encountered in B1 and B2 at a measured depth of 20' and 22' below grade, respectively. Drilling continued to a total depth of 42 feet in both borings, and groundwater wells were completed. Slotted 4" PVC casing extended from a depth of 11' to 42' below ground surface. Monterey #3 sand was used as a filter pack and extended from well bottom to the top of the slotted casing. Blank 4" PVC casing was set from a depth of 11' below surface to grade. A 1' bentonite seal was placed above the filter pack. Cement slurry filled the remaining annulus from 10' below surface to grade. Caps were placed on both ends of the casing and the water tight wellhead was fixed in a locking traffic box.

The wells recovered for over two weeks before water sampling. On July 17, 1987 PIC geologist Mr. Don Prince returned to the site and recovered one groundwater sample from each well. An appropriate volume of water was pre-bailed from the wells to ensure the recovery of representative samples. The samples were recovered with an acrylic bailer, placed on ice, and transported to Chemical Research Laboratories (see Appendix C; Chain of Custody). Neither of the water samples recovered from the wells had any field evidence of petroleum hydrocaron contamination.

GEOLOGY

Boring activity at the Sears facility revealed that the soil types underlying and surrounding the tank pit are composed of approximately 20' of gray to brown, cohesive clay overlying fine grained, micaceous, clayey sand. The elevation of the tank pit site is approximately 50' above sea level. Depth to groundwater is approximately 20' below surface, with east being the most likely direction of groundwater flow.

TESTING RESULTS

The soil and groundwater samples were transported the same day as recovery to Chemical Research Laboratories in Stanton. The soil samples collected on July 1, 1987 were tested for total petroleum hydrocarbons using EPA method 8015. The groundwater samples were tested for total petroleum hydrocarbons using EPA method 8015 and for aromatic volatile organics (BTX) using EPA method 602.

All of the soil samples except the one recovered from a depth of 20' below grade in B2 exhibited nondetectible levels of

total petroleum hydrocarbons. Sample B2 - 20' measured a total petroleum hydrocarbon concentration of 40 ppm. The groundwater sample recovered from B1 measured nondetectable total petroleum hydrocarbon and BTX concentrations at a detection limit of 100 ppb and 1 ppb respectively. The groundwater sample recovered from B2 measured a total petroleum hydrocarbon concentration of 2000 ppb, benzene concentration of 35 ppb, and a total xylene concentration of 15 ppb. Toluene and ethyl benzence were non detected at 10 ppb (see Appendix D; Laboratory Results).

CONCLUSIONS AND RECOMMENDATIONS

The drilling activity and groundwater investigation at the Sears facility suggest that although contamination does exist in the soil directly underlying the tank pit, soil contamination does not extend laterally, even in the down gradient direction. In addition, the vertical migration of the contaminant is confined by groundwater at a depth of 20'.

Based on these conclusions, PIC recommends that the gasoline-contaminated soil which was both removed from the tank pit and still underlies the former tank be excavated, spread, and passively soil farmed on the site. The Sears/Gardena facility is ideal for soil farming because a large paved area is available for spreading the soil, the farm can be placed over 300' from the nearest street, and the facility is located in an industrial area of Gardena so that a soil farm would present no substantial nuisance to residents. In addition, the volatility of gasoline results in a rapid attenuation of TPH levels in soil when

passively farmed. Upon documentation of successful soil remediation by passive aeration, the soil will be used as fill material in the excavated tank pit. Remediation of impacted groundwater will be coordinated with appropriate agencies including the California Regional Water Quality Control Board.

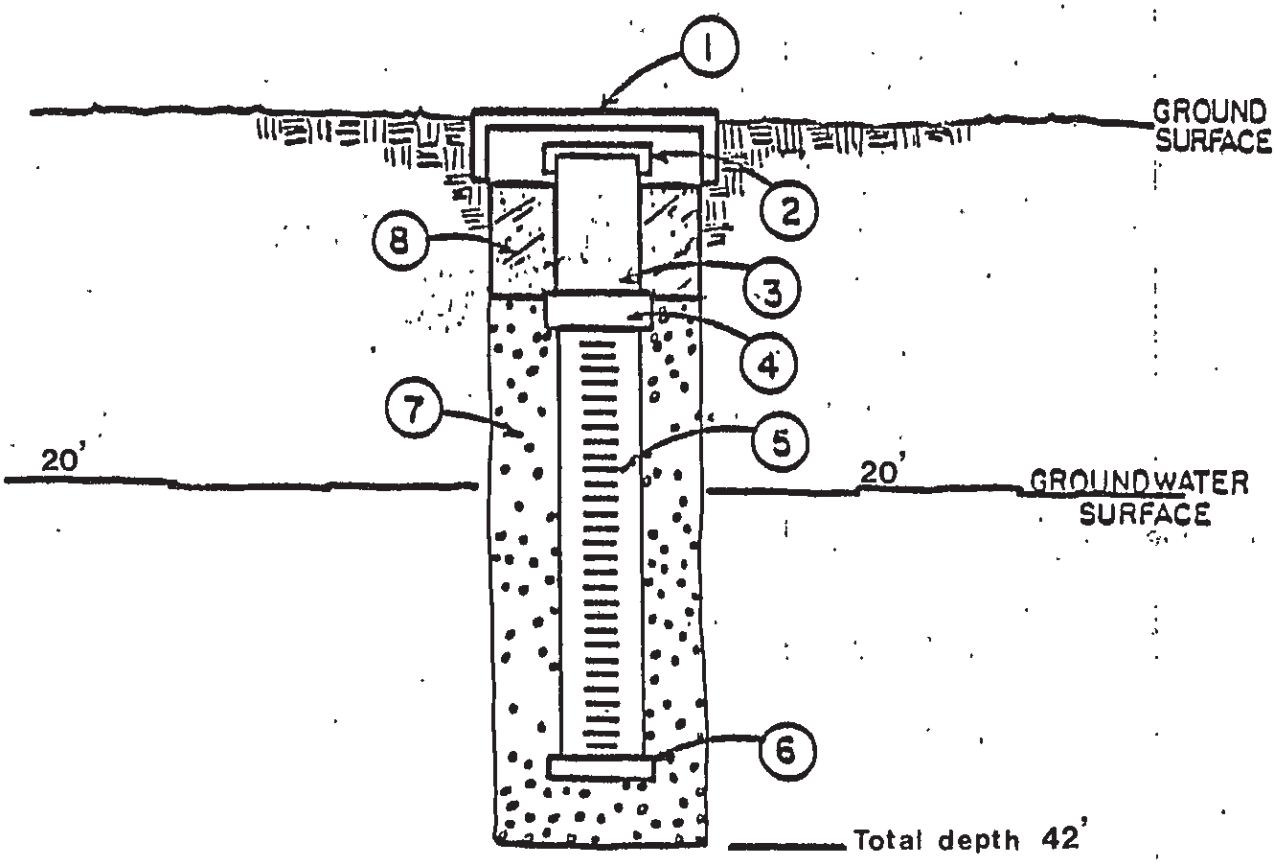
LEAK DETECTION SYSTEM
TYPICAL MONITORING WELL



ITEM LIST:

1. Traffic box
2. Water-tight locking cap
3. Four-inch diameter minimum
4. Coupling
5. Four-inch diameter minimum factory slotted schedule-40 PVC pipe or other compatible material. Slots shall extend from bottom of well to 10 feet above the highest anticipated groundwater level or to the bottom of the well seal.
6. End cap
7. Clean pea gravel or sand filter pack.
8. Bentonite well seal

GENERAL REQUIREMENTS:

A. Monitoring wells shall extend at least 20 feet below the lowest anticipated groundwater level and at least 15 feet below the bottom of the tanks. However, do not drill well through laterally extensive clay layers that are below the water table and are at least 5 feet thick.

B. Boring shall be 4" greater than the diameter of the well (10"diameter minimum boring).

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051, in order to complete the evaluation of Closure Permit No. 2683B.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.

[ ] Insufficient number of samples were obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[ ] Submit logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at DOHS certified laboratory.

[X] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil.

[ ] Signature on the report is required of CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

[X] Define the vertical and lateral extent of contamination.

[X] Propose a remedial action plan to mitigate contamination.

[ ] Other _____

Dear Mr. Warfield:

HAZARDOUS MATERIAL UNDERGROUND STORAGE
CLOSURE/SITE ASSESSMENT REPORT
CLOSURE PERMIT NO. 2683B
FACILITY LOCATION: 1917 West Artesia

This office has reviewed the closure report submitted on June 3, 1987, for the subject facility.

In order to better evaluate the report, the information indicated on the attached Additional Closure Requirements sheet must be submitted to this office by June 30, 1987.

If you have any questions regarding this matter, please contact Ms. Kelsey Schwartz at (213) 226-4437.

Very truly yours,

T. A. TIDEMANSON
Director of Public Works

SUMMARY

One gasoline tank was removed from the Sears Gardena facility on May 13, 1987. Two soil samples were recovered under L.A.C.D.P.W. Permit #2683B; an additional sample was taken at the request of Charlie Mellon from Hank's Service Station Maintenance. Only the sample recovered from the south end of the tank pit beneath the gasoline tank had a significant total petroleum hydrocarbon concentration (9300 ppm).

INTRODUCTION

Representatives from Sears contracted with Hanks Service Station Maintenance to remove from their facility one (1) underground storage tank (see Figure 1; Site Location Map). Tank removal operations were completed on Wednesday, May 13, 1987. Upon excavation, one (1) 1000 gallon gasoline tank was uncovered and removed (see Figure 2; Site Sketch Map). In accordance with tank removal permit #2683B, issued by the Los Angeles County department of Public Works, Engineering Services Division, two

(2) soil samples were recovered from under the tank. An additional sample was recovered at a depth of four (4) feet below surface from the west wall of the tank pit as specified by Charlie Mellon of Hank's Service Station Maintenance. The samples were collected and chemically analyzed to document the subsurface soil conditions.

Petroleum Industry Consultants (PIC) was contracted (in-house job E461) to provide a geologist on site to: 1) conduct a visual inspection of lithology; 2) recover specified soil samples from the bottom of the tank pit; 3) oversee subsequent laboratory testing of soil samples; and 4) prepare this geologic report of tank removal operations. This report documents the field procedures and test results for soil samples recovered during the excavation and laboratory evaluation of this tank pit site.

PROCEDURE

Tank pit excavation was completed the morning of May 13, 1987. A backhoe was used to remove soil from above and beside the tank. After lower explosion levels registered below 10 percent in all the tanks, onsite City of Gardena Fire Inspector Solley allowed removal operations to continue. The tank was loaded onto a truck and transported to AMR in Ontario.

To facilitate transport and visual inspection for structural integrity, the tank sides and bottom were scraped to remove excess soil. The tank had no obvious holes or cracks, but there was evidence of soil contamination above the tank to the ground surface. After the tank had been removed from the tank pit, PIC

staff geologist, Mr. Don Prince, recovered three (3) samples; one from beneath each end of the tank at a depth of 2 feet below tank bottom and an additional sample excavated off the west wall of the tank pit (sample P3) as specified by Hank's Service Station Maintenance representative Charlie Mellon. Each sample was collected in a glass jar and sealed with an aluminum lid. The sample jars were placed in ice and transported to Chemical Research Laboratories for specified testing and analysis (see Appendix A; Chain of Custody).

Tank removal operations and soil sampling were completed by 1:00 P.M. and the representative from PIC was released from the site.

GEOLOGY

A visual inspection of the stratigraphy exposed along the sides of the tank pit revealed that the predominant soil type from ground surface to a depth of 10 feet was dark brown, massive, medium grained, clayey sand. The tank pit had been originally backfilled with native soil.

The elevation of the tank pit site is approximately 50 feet above sea level; the surrounding topography slopes east: (see Figure 3; Area Topographic Map). The groundwater contour map published by the L.A.C.F.C.D. shows the most likely direction of groundwater flow to be east, parallel to the nearby Dominguez channel. Depth to the first principal aquifer beneath the site is approximately 100 feet below surface; semi-perched zones may occur at shallower depths (see Figure 4; L.A.C.F.C.D. Groundwater contour map).

TESTING AND RESULTS

The soil samples were transported the same day to Chemical Research Laboratories, 11631 Seaboard Circle, Stanton, California for specified quantitative testing for organic lead and total petroleum hydrocarbons (TPH) using EPA Method 8015. With the exception of sample P2, which had a reported TPH level of 9300 ppm, all the samples had TPH concentrations less than or equal to 3 ppm, and organic lead concentrations less than or equal to 1 ppm. These laboratory findings confirm that, there is limited soil contamination in the tank pit.

This report is proprietary and confidential, to be delivered to, and intended for the exclusive use of, the above named client only. Petroleum Industry Consultants, Inc. assumes no responsibility nor liability for the reliance herein or use hereof by anyone other than the above named client. In addition, all of the lab work cited in this report was prepared under the supervision of Mike Hiatt of Chemical Research Laboratories, Stanton, who is solely responsible for the contents and conclusions of the laboratory data.

Should you have any additional questions or comments regarding the procedures or results outlined in this report, please do no hesitate to call us at 714/898-6399.

Respectfully submitted,

J. Tim Hersch

CL205 Revised 9/86

CONDITIONS A -- GENERAL

1. Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer-Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.

2. The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:

   a. Removal of tank shall require a three (3) business day advance notification.

   b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.

3. The fee is $141 for the first tank plus $38 for each additional tank.

4. All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any or all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.

5. A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.

6. Well destruction shall be accomplished according to methods described in the latest "Water Well Standards: State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.

7. Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.

8. Decontamination shall require the following, as a minimum:

   a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.

   b. The personnel shall be sufficiently skilled to safely carry out such operation.

   c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.

   d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

1. All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks," Part A and any other applicable Parts.

2. A temporary closure shall not exceed 90 days.

CONDITIONS C -- PERMANENT, TANK(S) REMOVAL

1. All tank removals shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Part D and any other applicable Parts.

2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.

3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.

4. If an appointment has been arranged with a County Engineer inspector to inspect the removal of a tank, the inspector will only wait at the site a reasonable amount of time (approximately one hour) after arriving for the removal to commence. Another closure fee may be charged if the inspector has to return to the site.

5. After inspection, tanks shall be transported to a legal disposal point.

6. If the tank had stored materials other than motor fuel, fuel oil, or waste oil, site integrity shall be demonstrated using the soil sampling and analysis procedures described in CONDITIONS D below.

7. The site shall be backfilled and recompacted to a relative compaction of 90%.

CONDITIONS D -- PERMANENT, TANK(S) IN PLACE

1. All permanent closures of tanks in place shall comply with Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Parts B or C, and any other applicable Parts.

2. Owners/operators shall demonstrate part site integrity as follows:

   a. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the report in 2.h. below.

   b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.

   c. For multiple tanks, as a minimum, borings shall be placed at 20 foot intervals around the tank cluster. The actual number and location of borings shall be evaluated on a case-by-case basis. Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.

   d. Soil samples shall be taken at depths of 5, 10, 20, 30 and 40 feet below grade level.

   e. A Shelby Tube or a Modified California Sampler shall be utilized for taking all soil samples.

   f. Soil samples shall be capped immediately with teflon or aluminum.

   g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.

   h. A report containing the results of the above analysis shall be submitted to the County Engineer.

3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter V of the County's "Underground Storage of Hazardous Materials -- Guidelines."

4. A report shall be submitted to the County Engineer containing the results of the site investigation.

CLOSURE PERMIT SUPPLEMENT
HAZARDOUS MATERIALS UNDERGROUND STORAGE
LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
2250 ALCAZAR STREET
LOS ANGELES, CALIFORNIA 90033

Closure Permit No. 2693 B
File No. I-13475-2B

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
1A,B	2' TO 4' BELOW TANK INVERT	T. P. H. / ORGANIC LEAD	EPA 8015

3. All soil samples obtained shall be undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

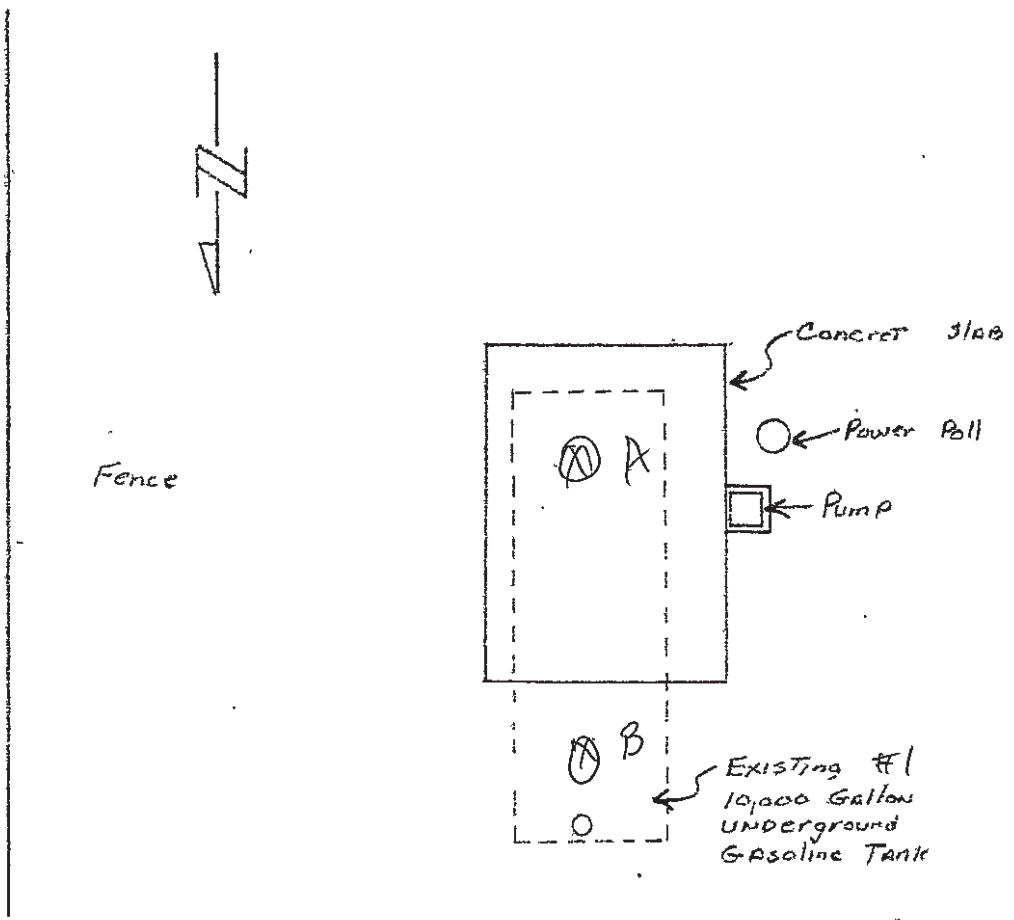
5. The analysis results for all soil samples shall be expressed in milligrams per kilogram (mg/kg). Analysis results for groundwater samples shall be expressed in parts per billion (ppb).

6. Analysis results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) The method of analysis.

7. All soil/groundwater samples obtained shall be handled and transported to a laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever earlier.



Scope

1. Remove remaing material From The Tank
2. Rinse The Tank To Render IT SAFE For removal
3. Obtain Soil Samples As required

LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
CLOSURE REPORT REQUIREMENTS

A closure report will be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051 containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
3. Description of methods for obtaining, handling and transporting samples.
4. Time and date samples were obtained.
5. If borings were established, boring logs certified by a CA registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.
6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.

Signature Charles R. Mellon Date May 6, 1987

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.
